#	QUESTIONS	ANS	DR. KHALID'S EXPLANATION
1.	46. A woman comes with an ulcerated lesion 3 cm		Key is B. Superficial inguinal LN.
	in the labia majorum. What is the lymphatic		, ,
	drainage of this area?		A
	a. External iliac		$\triangle$ $\square$ $\vdash$
	b. Superficial inguinal LN	<b>9</b> /	
	c. Para-aortic		
	d. Iliac		
	e. Aortic		
2.	88. A 45yo man with posterior gastric ulcer		The key is E. Lesser sac.
	presented with severe excruciating pain which		
	subsided		
	after conservative treatment. 10 days later he		
	developed swinging pyrexia. US shows a		
	collection in the peritoneum. What will be the		
	most likely location of the collection?		
	a. Hepatorenal puch		
	b. Left paracolic gutter		
	c. Subphrenic	/	8
	d. Pelvic cavity		
	e. Lesser sac		
3.	307. A 46yo man is being treated for a pleural		The key is C. Intercostal artery. [Most
	effusion. A chest drain has been sited just below		vulnerable structure is intercostal nerve,
	the		then intercostal artery then intercostals
	4th rib in the mid-axillary line on his right side.		vein. As intercostal nerve is not in option
	What single structure is at particular risk of injury?		intercostal artery is the answer here].
	a. Arzygos vein b. Diaphragm		
	c. Intercostal artery		
	d. Internal thoracic artery		
	e. Liver		
4.	321. A 67yo female who had undergone a radical	,	The key is D. Axillary group of LN. [Axillary
	mastectomy now comes with the complaint of		clearance compromise lymphatic flow and
	swelling and redness in her right upper limb.		may results in swelling of upper limb].
	Involvement of which of the following structures		
	explain these symptoms?		
	a. Epitrochlear LN		
	b. Cephalic vein		
	c. Subclavian artery		
	d. Axillary group of LN		
	e. Long thoracic nerve		
5.	325. In 85% of the population this artery is		The key is E. Right coronary artery.
	dominant. What is the single most appropriate		If the posterior discending artery is supplied
	option?		by the circumflex artery then it is left
	a. Left ant descending artery	<b>1</b>	dominant and if posterior descending artery
	b. Coronary sinus		is supplied by the right coronary artery then
	c. Circumflex artery		it is right dominant. As in 85% of population
	d. Left main stem, post descending artery		posterior descending artery is supplied by
	e. Right coronary artery		right coronary artery it is called the

			dominant that is right coronary artery is
			dominant.
6.	417. A 34yo man with a white patch on the margin of the mid-third of the tongue. Which is the single most appropriate LN involved?  a. External iliac LN  b. Pre-aortic LN		The key is G. Submandibular LN.
	b. Pre-aortic LN c. Aortic LN d. Inguinal LN e. Iliac LN f. Submental LN	5/	ALE
	g. Submandibular LN h. Deep cervical LN		
7.	427. A 63yo lady with a BMI=32 comes to the ED		The key is A. Short saphenous vein. [short
	with complaints of pigmentation on her legs. Exam:		saphenous vein travels lateral aspect of
	dilated veins could be seen on the lateral side of		ankle while great or long saphenous vein
	her ankle. Which of the following is involved?		travels medial aspect of ankle].
	a. Short saphenous vein		
	b. Long saphenous vein c. Deep venous system		
	d. Popliteal veins		
	e. Saphano-femoral junction		B
8.	445. A 64yo woman has difficulty moving her right		The key is A. Accessory nerve.
0.	shoulder on recovering from surgery of the		the ney is a violessory herver
	posterior triangle of her neck. What is the single		
	most appropriate option?		
	a. Accessory nerve		
	b. Glossopharyngeal nerve		
	c. Hypoglossal nerve		
	d. Vagus nerve		
	e. Vestibule-cochlear nerve		
9.	446. A 37yo man with an ulcer on the medial		The key is D. Inguinal LN.
	malleolus. Which of the following LN is involved?		
	a. External iliac LN	,	
	b. Pre-aortic LN		
	c. Aortic LN		
	d. Inguinal LN e. Iliac LN		
	f. Submental LN		
	g. Submandibular LN		
	h. Deep cervical LN		
10.	474. L1 level, what is the most appropriate		The given key is D. Which is a wrong key.
	landmark?		The correct key is E. Transpyloric plane. [
	a. Mcburney's point		The termination of the spinal cord is
	b. Stellate ganglion		between L1 and L2 (variable between
	c. Deep inguinal ring		people). L1 landmark- duodenum first part,
	d. Termination of the spinal cord		superior mesenteric artery, hila of both
	e. Transpyloric plane		kidneys, upper border of pancreas, splenic
			artery, pylorus and fundus of gall bladder].
	<u> </u>		

11.	514. Midpoint between the suprasternal notch and		The key is E. Transpyloric plane.
	pubic symphysis. What is the single most		,
	appropriate landmark?		
	a. Fundus of the gallbladder		
	b. Mcburney's point		
	c. Stellate ganglion		
	d. Deep inguinal ring		
	e. Transpyloric plane		
12.	515. Tip of the 9th costal cartilage. What is the		The key is A. Fundus of the gallbladder.
	single most appropriate landmark?		
	a. Fundus of the gallbladder		
	b. Deep inguinal ring		
	c. Termination of the spinal cord		
	d. Transpyloric plane		
	e. Vena cava opening in the diaphragm		
13.	524. Just above the mid-inguinal point. What is the		The key is D. Deep inguinal ring.
	single most appropriate landmark?		
	a. Femoral artery pulse felt		
	b. Mcburney's point		
	c. Stellate ganglion		
	d. Deep inguinal ring		
	e. Transpyloric plane		S
14.	525. 5th ICS in the ant axillary line. What is the	_ \	B. Chest drain insertion.
	single most appropriate landmark?	1)	
	a. Apex beat	"	
	b. Chest drain insertion		
	c. Stellate ganglion		
	d. Transpyloric plane		
	e. Vena cava opening into the diaphragm		
15.	590. A 35yo pregnant woman has been having		The key is B. Transverse carpal ligament.
	tingling and numbness of her thumb, index and		[This is a case of carpal tunnel syndrome. So
	middle fingers for a while. She has been treated		transverse carpal ligament is the structure
	with local steroids but it hasn't helped her much		which will be incised].
	and now she has planned to undergo a surgical	,	
	procedure. Which of the following structures will		
	be incised?		
	a. Flexor digitorum profundus		
	b. Transverse carpal ligament c. Palmar aponeurosis		
	·		
16.	d. Extensor retinaculum  600. Which artery runs in the anterior inter-		B. Left anterior descending artery.
10.	ventricular groove?		b. Left differior descending differy.
	a. Acute marginal branch		
	b. Left ant descending artery		
	c. Septal branches		
	d. Circumflex artery		A
	e. Right coronary artery		$\Delta$   $\vdash$
	cgcoronary artery		\

scrotum. Which of the following LN is involved?	5 D. Mgamar Liv.
a. External iliac LN	
b. Pre-aortic LN	
c. Aortic LN	
d. Inguinal LN	
	_
e. Iliac LN f. Submental LN	<u> </u>
g. Submandibular LN	_
h. Deep cervical LN	
18. 717. In perforation of a post gastric ulcer, where	
	s C. Losson son
a. Left paracolic gutter	s C. Lesser sac.
b. Pelvic cavity	
c. Lesser sac	
d. Under the diaphragm	
e. Right paracolic gutter	s D. Inquinal I N
	s D. Inguinal LN.
below the umbilicus on the right side. What is the	
single most appropriate lymph node?	
a. External iliac LN	
b. Pre-aortic LN	
c. Aortic LN	<b>&gt;</b>
d. Inguinal LN	
e. Iliac LN	~ \
f. Submental LN	
g. Submandibular LN	
h. Deep cervical LN	d University
	s C. Linea alba.
surgery midline port during gallstone removal.	
a. External iliac muscle	
b. Cricoid cartilage	
c. Linea alba	
d. Rectus sheath muscle	
e. Duramater	
f. 1st tracheal cartilage	
g. Conjoined tendon	
h. Intercostal muscles	- F. Johannaskal
	s E. Intercostal muscles.
is the most appropriate anatomical structure?	
a. External iliac muscle	
b. Linea alba	
c. Rectus sheath muscle	
d. Conjoined tendon	
e. Intercostal muscles	
	is C. Duramater.
appropriate anatomical structure will be pierced?	
a. Cricoid cartilage	
b. Rectus sheath muscle	
c. Duramater	
d. Conjoined tendon e. Intercostal muscles	

23.	828. A child is not breathing and intubation failed.	The key is B. Cricoid cartilage. [Incision for
	At what anatomical site should the incision made?	tracheostomy is done which goes down
	a. External iliac muscle	from cricoids cartilage].
	b. Cricoid cartilage	
	c. Linea alba	
	d. Rectus sheath muscle	
	e. Duramater	
	e. Duramater f. 1st tracheal cartilage	AIF
	g. Conjoined tendon	
	h. Intercostal muscles	
24.	960. Post gastric ulcer got perforated leading to	D. Under the diaphragm. [Correct option
	bleeding involving the gastro-duodenal artery.	probably A. Left paracolic gutter].
	Where would fluid accumulate in the cavity?	
	a. Left paracolic gutter	
	b. Pelvic cavity	
	c. First part of duodenum	
	d. Under the diaphragm	
	e. Retroperitoneal	
25.	1042. A middle aged woman has some weakness of	The key is A. C7/T1.
	hand after an injury. Which vertebra will be the	
	lowest to be included on cervical XR to dx the	
	injury?	\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\\
	a. C7/T1	
	b. C8/T1	
	c. C5/C6	
	d. C6/C7	
26.	1078. Pt with pain and swelling in left leg and thigh	There are two keys B. Left common iliac
	up to the level of inguinal ligament. Where is the	artery. and D. Femoral artery. Correct key is
	level of occlusion?	B. Left common iliac artery. [General rule is
	a. Femoro-popliteal artery	occlusion occurs in proximal bifarcation. So
	b. Left common iliac artery	the correct key is B. Left common iliac
	c. Aortoiliac artery	artery. That is occlusion in the bifarcation of
	d. Femoral artery	left common iliac artery (as femoral artery
	e. Profound femoral artery	bifarcates more distally to superficial and
		deep branches)].
27.	1228. A 67yo lady with an ulcer on the anal margin.	The key is D. Inguinal LN. [Anal canal below
	Which is the single most appropriate LN involved?	pectinate line is drained into superficial
	a. External iliac LN	inguinal lymph nodes].
	b. Pre-aortic LN	
	c. Aortic LN	
	d. Inguinal LN	
	e. Iliac LN	
28.	1229. A branch of the dominant coronary artery	The key is D. Left main stem, post
	that supplies the inferior portion of the septum.	descending artery. [Here no option is
	What	satisfactorily correct! By dominant coronary
	is the single most appropriate option?	artery we mean that coronary artery which
	a. Septal branches	gives of the branch of posterior descending
	b. Obtuse marginal branches	artery. Mostly it is right coronary artery and
	c. Circumflex artery	if there is left coronary dominance, posterior
	d. Left main stem, post descending artery	descending artery is the branch of
	e. Diagonal branch	circumflex artery and not direct branch of
		left main artery. However the only option

		that goes nearer is D. Left main stem, post.
		descending artery].
29.	1239. The artery that supplies the ant right ventricular wall. What is the single most appropriate option?	The key is A. Acute marginal branch.
	a. Acute marginal branch b. Left ant descending artery c. Coronary sinus d. Circumflex artery	SALE
	e. Right coronary artery	
30.	1255. The artery that runs along the left AV	The key is C. Circumflex artery.
30.	groove. What is the single appropriate option?	The key is c. enconnex artery.
	a. Left internal mammary artery	
	b. Left anterior descending artery	
	c. Circumflex artery	
	d. Left main stem (LMS) post descending artery	
	e. Diagonal branch	
31.	1346. An 89yo man presents with carcinoma of	The key is E. Deep cervical LN.
	posterior oropharynx. Which is the single most	
	appropriate LN involved?	
	a. Pre-aortic LN	V~~
	b. Aortic LN	
	c. Submental LN	
	d. Submandibular LN	
32.	e. Deep cervical LN	The key is D. Internal phlique and
32.	1382. During a laparoscopic procedure, a trochar is inserted halfway between the umbilicus and the	The key is D. Internal oblique and transversus abdominis.
	ant superior iliac spine. What are the structures	transversas abaominis.
	most likely to be pierced?	
	a. Rectus sheath	
	b. Linea alba	
	c. External oblique aponeurosis	
	d. Internal oblique and transverse abdominal	
	e. Both C and D

1.	3. A 44yo woman has lost weight over 12 months. She has		The key is B. TFT. [The patient has
	also noticed episodes where her heart beats rapidly and		paroxysmal atrial fibrillation That is why
	strongly. She has a regular pulse rate of 90bpm. Her ECG		there is no arrhythmia in between
	shows sinus rhythm. What is the most appropriate inv to be		attacks. From the given option TFT is
	done?	Λ 4	the appropriate test as thyrotoxycosis is
	a. Thyroid antibodies	A	a leading cause of paroxysmal atrial
	b. TFT		fibrillation and this ladies weight loss
	c. ECG		also makes thyrotoxycosis as the
	d. Echocardiogram		probable cause here].
	e. Plasma gLucose		
2.	43. A man brought into the ED after being stabbed in the		The key is B. Cardiac tamponade. [chest
	chest. Chest is bilaterally clear with muffled heart sounds. BP		is clear, so there is no pneumothorax or
	is 60/nil. Pulse is 120bpm. JVP raised. What is the most likely		pleural effusion. Muffled heart sound is
	dx?		due to fluid in pericardial space, low BP
	a. Pulmonary embolism		from reduced chamber expansion due
	b. Cardiac tamponade		to pericardial fluid's pressure and
	c. Pericardial effusion		restricted right heart expansion causes
	d. Hemothorax		raised JVP].
	e. Pneumothorax		
3.	55. A 75yo man collapsed while walking in his garden. He		B. Echo. [Aortic stenosis – more likely in
	recovered fully within 30 mins with BP 110/80 mmHg and		elderly. And hypertrophic
	regular pulse of 70bpm. He has a systolic murmur on	//	cardiomyopathy – less likely in this age,
	examination. His activities have been reduced lately which he		presentation may be in an earlier age].
	attributes to old age. What is the definitive diagnostic inv that		
	will assist you with his condition?		
	a. ECG		
	b. Echo		
	c. 24h ECG monitoring		
	d. 24h BP monitoring		
	e. Prv CIN		
4.	87. A man with prosthetic heart valve underwent		The key is B. Blood culture.
	hemicolectomy and after some days complains of left		The diagnosis is infective endocarditis.
	hypochondriac pain, fever and has a systolic murmur. What is		Fever + new murmur = endocarditis
	the next inv to ascertain the cause of HF?		until proven otherwise.
	a. CT		Important risk factors: dermatitis, IV
	b. Blood culture		injections, renal failure, organ
	c. ECG		transplantation, DM, post operative
	d. MRI		wond. Risk factors for abnormal valves:
	e. Radioactive thyroid scan		aortic or mitral valve disease, tricuspid
			valve in IV drug users, prosthetic valves.
5.	106. A 45yo lady has 10m hx of SOB. She is found to have		The key is B. Atrial septal defect.
	irregularly irregular pulse and loud P2 with fixed splitting and		Diagnosis is ASD with atrial fibrillation.
	ejection systolic murmur in left 2nd ICS. What is the probable	_	[i) atrial fibrillation = irregularly irregular
	dx?	$\Lambda$	pulse. ii) ASD = SOB, fixed splitting with
	a. TOF	$\mathcal{H}$	loud P2, ESM in pulmonary area]. This
	b. ASD		picture is typical. One should not
	c. VSD		misdiagnose SOB, ESM in pulmonary
	d. PDA		area and loud P2 as pulmonary
	e. CoA		hypertension (though in elderly this can
			develop with ASD).

7.	108. A 76yo is treated with HTN. He suffers from pain and redness at the MTP joint of his right big toe. Which of the following anti-HTN cause this symptoms?  a. Losartan b. Bendroflumethiazide c. Ramipril d. Bisoprolol e. Verapamil  113. A 72yo man has been advised to have antibiotic prophylaxis for some years now before dental tx. He has never experienced chest pain. Three weeks ago, he noticed breathlessness on exertion and for one week he had orthopnea. His pulse is normal. What is the most probable dx? a. Aortic regurgitation	<del>S</del> A	The key is B. Bendroflumethiazide Diagnosis is acute gout. Thiazide diuretics may cause hyperuricemia and thus cause or precipitate gout.  The kay is E. Mitral valve stenosis. [Mitral stenosis is the most common valvular complication of rheumatic fever].
	b. Ischemic mitral regurgitation c. Mitral valve prolapse d. Pulmonary stenosis e. Mitral valve stenosis		
8.	119. A 4yo girl is found to have bounding pulse and continuous machinery murmur. What is the most probable dx? a. TOF b. ASD c. VSD d. PDA e. CoA	0	The key is D. PDA. [Continuous mechinary murmur is well known feature of PDA].
9.	120. A 12yo child with episodes of sudden bluish discoloration and brief loss of consciousness. Exam: clubbing, central cyanosis, systolic thrill with systolic ejection murmur in 2nd left ICS. What is the most probable dx?  a. TOF  b. ASD  c. VSD  d. PDA  e. CoA		The key A. TOF. [TOF usually does not become symptomatic at birth or early infancy and given features (central cyanosis and clubbing with murmur of right ventricular outflow obstruction i.e. ejection systolic murmur in 2 <sup>nd</sup> left ICS) are well known features of TOF].  [Tetralogy of fallot = 1. VSD + 2.  Overriding of the aorta + Right ventricular outflow tract obstruction + Right ventricular hypertrophy].
10.	137. A 67yo man presents with palpitations. ECG shows an irregular rhythm and HR=140bpm. He is otherwise stable, BP=124/80mmHg. What is the most appropriate management?  a. Bisoprolol  b. ACEi  c. Ramipril  d. Digoxin		The key is A. Bisoprolol. [In acute AF (<48h) if stable rate control by verapamil 40-120mg/8hourly po or bisoprolol 2.5-5mg/d po. In chronic AF (>48h) rate control with beta-blocker or rate limiting CCB; OHCM, 9 <sup>th</sup> edition, page-124].
11.	140. A 67yo man had successful thrombolysis for an inf MI 1 month ago and was discharged after 5days. He is now readmitted with pulmonary edema. What is the most probable dx?  a. Aortic regurgitation b. Ischemic mitral regurgitation c. Mitral valve prolapse d. Pulmonary stenosis e. Rheumatic mitral valve stenosis	SA	The key is B. Ischaemic mitral regurgitation. [ischaemic mitral regurgitation > raised pulmonary capillary pressure > pulmonary oedema]. [Inferior myocardial infarction causes left ventricular remodeling, which displaces posterior papillary muscle away from its normal

		1	nacitian landing to implemia mitual
			position, leading to ischemic mitral
12.	141 A COve lady who had strake 2 years are new reports		regurgitation].

17.	169. A 40yo man collapsed at home and died. The GPs report says he suffered from T2DM and BMI=35. What is the most		The key is A. MI. In diabetics MI become painless when
	likely cause of death?		the patient develop autonomic
	a. MI		neuropathy (till there is no autonomic
	b. DM		
	1		neuropathy diabetic patients will feel
	c. HF		MI pain). In this case the disease was
	d. PE		unnoticed as it was a painless attack.
40	e. Renal failure	$\Delta$	
18.	205. 46yo man, known case of chronic GN presents to OPD.	// \	
	He feels well. BP = 140/90mmHg. Urine dipstick: protein ++,		
	blood ++ and serum creatinine=106mmol/L. Which		
	medication can prevent the progression of this dx?		_
	a. ACEi		The key is A. ACEI. [renal impairment is
	b. Diuretics		delayed by ACEI].
	c. Cytotoxic meds		
	d. Longterm antibiotics		
	e. Steroids		
19.	247. A 40 yo manic depressive is noted to have high serum		The key is E. Thiazide. [Thiazide was
	levels of lithium and profound hypokalemia. His GP had		prescribed for Hpt and when lithium
	started him on anti-HTNs. Choose the single most likely		was prescribed its level increased due
	cause?		to thiazide and thiazide also caused
	a. Verapamil	13	hypokalemia resulting The given
	b. Amiodarone		picture].
	c. Ranitidine		
	d. Lithium	//	
	e. Thiazide		
20.	256. A 6wk child presents with progressive cyanosis, poor		The key is E. Tetralogy of Fallot. It is a
	feeding, tachypnea over the first 2 wks of life and holosystolic		wrong key!! Correct answer is C.
	murmur. What is the most appropriate condition?		tricuspid atresia.
	a. ASD		Points in favour: i) tachypnoea over first
	b. VSD		2 wks of life ii)progressive cyanosis iii)
	c. Tricuspid atresia		poor feeding iv) holosystolic murmur of
	d. PDA		VSD.
	e. TOf		
21.	261. A baby born at 34 weeks with a heart murmur is kept in		The key is A. PDA.
	the incubator for almost 4 weeks. There is no murmur at		As it is more common in premature
	discharge. What is the likely cause of this murmur?		baby! Management:
	a. PDA		indomethacin closes the connection in
	b. TOF		the majority of cases
	c. Aneurysm of sinus of Valsalva		if associated with another congenital
	d. Aorto-pulmonary septal defect		heart defect amenable to surgery then
	e. AVM		prostaglandin E1 is useful to keep the
	C. AVIVI		duct open until after surgical repair.
22.	298. An 18yo man complains of fatigue and dyspnea, he has		The key is C. VSD.
~~.	, , , , , , , , , , , , , , , , , , , ,		THE KEY IS C. VSD.
	left parasternal heave and systolic thrill with a harsh pan-systolic murmur at left parasternal edge.		
	i willi a narsh ban-systolic murmur at left barasternal edge.		
1			
	What is the most probable dx?	$\Delta$	
	What is the most probable dx? a. TOF	A	LE
	What is the most probable dx? a. TOF b. ASD	A	
	What is the most probable dx? a. TOF b. ASD c. VSD	A	
	What is the most probable dx? a. TOF b. ASD	βA	

23.	306. An MI pt who is already on aspirin no longer smokes and		The key is D. Statin + ACEi.
	his cholesterol, ECG, echo and BP are		Offer all people who have had an acute
	normal. Choose the best option for him:		MI treatment with the following drugs:
	a. Give statin		ACE (angiotensin-converting
	b. Give statin+warfarin		enzyme) inhibitor
	c. Low cholesterol diet		dual antiplatelet therapy
	d Statin+ACEi		(aspirin plus a second antiplatelet
	NOT FOR S		agent)
	NULTUR 3	A	beta-blocker
	110110110		• statin. [2007, amended 2013]
			[NICE guideline].
24.	322. A 50yo smoker and heavy drinker presents with		The key is B. Reassure. [Smoking and
	complaints of racing heart. A 24h ECG comes out normal.		alcohol excess can cause palpitation
	What is your next step in management?		without any recognizable arrhythmia
	a. ECHO		and for this no treatment is required].
	b. Reassure		
	c. Stress test		
25.	333. A 60yo pt who has had a MI a week back presents with		The key is C. Dressler's syndrome.
	dyspnea and pericardial rub. ECG shows ST elevation. CXR:	1	There is pericardial rub there is
	loss of margin at costo-vertebral angle. What is the single		pericarditis and in pericarditis there is
	most likely cause?		widespread ST elevation. So the
	a. Cardiac tamponade	18	condition is not new MI but Dressler's
	b. Mitral regurge		syndrome.
	c. Dressler's syndrome	1	<b> </b>
	d. Atrial fib		
	e. Emboli	)	
26.	344. A 68yo man gets repeated attacks of LOC and TIA. What		The key is E. Carotid artery stenosis.
	is the most likely cause for this?		
	a. Atrial fib		
	b. Mitral stenosis		
	c. Aortic stenosis		
	d. HOCM		
	e. Carotid artery stenosis	,	
27.	347. A 57yo woman who is suffering from HTN, presented to		The key is C. Thiazide. [It causes
	the hospital with complaints of recurrent falls when trying to		postural hypotension by volume
	get out of bed or getting up from sitting. She is on some anti-		depletion].
	HTN therapy with no other med prbs. What is the cause of her		
	fall?		
	a. CCB		
	b. Vertibrobasiliar insufficiency		
	c. Thiazide	1	
	d. Hypoglycemia		
	e. Infection		
28.	350. A 28yo shipyard worker was admitted for pain in calf		The key is A. Thromboangitis obliter
	while at work which has been increasing over the last 3m.	1	2. i) young age ii) smoker iii) pain in cuff
	There is no hx of HTN or DM but he is a smoker. Exam: loss of		iv) loss of posterior tibial and dorsalis
	posterior tibial and dorsalis pedis pulsation along with a non-		pedis pulsation v) non-healing ulcer at
	healing ulcer at the base of the right 1st MTP joint.		the base of the right 1 <sup>st</sup> MTP joint all are
	What is the most probably dx?	1	suggestive of Buerger's disease.
	a. Thromboangitis obliterans	1	
	b. Sciatica		
	c. DVT		
1	d. Baker's cyst e. Embolus		

30.	353. A 47yo man with hx of IHD complains of chest pain with SOB on exertion over the past few days. ECG normal, Echo=increased EF and decreased septal wall thickness. What is the most likely dx? a. Dilated CM b. Constrictive pericarditis c. Amyloidosis d. Subacute endocarditis  356. A 1m boy has been brought to the ED, conscious but with	A	The key is A. Dilated CM. [In dilated cardiomyopathy ejection fraction is decreased (but here increased which goes in favour of constrictive pericarditis). On the other hand decreased septal wall thickness favours the diagnosis of dilated cardiomyopathy. So it seems to be a bad recall!!].  The key is D. Synchrnized DC
30.	cool peripheries and has HR=222bpm. He has been irritable and feeding poorly for 24h. CXR=borderline enlarged heart with clear lung fields. ECG=regular narrow complex tachycardia, with difficulty identifying p wave. What is the single most appropriate immediate tx?  a. Administer fluid bolus b. Administer oxygen c. Oral beta-blockers d. Synchronized DC cardio-version e. Unilateral carotid sinus massage		cardioversion. As the patient is in probable hemodynamic instability (suggested by cool peripheries) so we should go for DC cardioversion. Probable diagnosis is SVT.
31.	a. Metoprolol b. Digoxin c. Carotid sinus massage d. Adenosine e. Amiodarone.		The key is A. Metoprolol. [P waves are replaced by fibrillatory f-waves. Irregular R-R intervals. Dx atrial fibrillation].
32.	381. ECG of an 80yo pt of ICH shows saw-tooth like waves, QRS complex of 80ms duration, ventricular rate=150/min and regular R-R interval. What is the most porbable dx? a. Atrial fib b. Atrial flutter c. SVT d. Mobitz type1 second degree heart block e. Sinus tachycardia		The key is B. Atrial flutter. [Saw-tooth like waves, normal QRS complex of 80 ms (normal range 70-100 ms), ventricular rate of 150/min and regular R-R interval is diagnostic of atrial flutter].
33.	386. A 39yo man with acute renal failure presents with palpitations. His ECG shows tall tented T waves and wide QRS complex. What is the next best step?  a. Dialysis b. IV calcium chloride c. IV insulin w/ dextrose d. Calcium resonium e. Nebulized salbutamol	A	1. The key is B. IV calcium chloride (both IV calcium gluconate or IV calcium chloride can be used when there is ECG changes). 2. The ECG changes are suggestive of Hyperkalemia. 3. At potassium level of >5.5mEq/L occurs tall tented T waves and at potassium level >7mEq/L occurs wide QRS complex with bizarre QRS morphology.

34.	402. A 61yo man has been referred to the OPD with frequent		The key is E. 24h ECG.
	episodes of breathlessness and chest pain a/w palpitations.		Indications of 24 h ambulatory holter
	He has a regular pulse rate=60bpm. ECG=sinus rhythm. What		monitoring:
	is the most appropriate inv to be done?		<ul> <li>To evaluate chest pain not</li> </ul>
	a. Cardiac enzymes		reproduced with exercise testing
	b. CXR		<ul> <li>To evaluate other signs and</li> </ul>
	c. ECG d. Echo		symptoms that may be heart-related,
	d. Echo		such as fatigue, shortness of breath,
	e. 24h ECG		dizziness, or fainting
			<ul> <li>To identify arrhythmias or</li> </ul>
			palpitations
			<ul> <li>To assess risk for future heart-</li> </ul>
			related events in certain conditions,
			such as idiopathic hypertrophic
			cardiomyopathy, post-heart attack
			with weakness of the left side of the
			heart, or Wolff-Parkinson-White
			syndrome
			To assess the function of an
			implanted pacemaker
		13	To determine the effectiveness
			of therapy for complex arrhythmias
35.	406. A woman had an MI. She was breathless and is put on		The key is B. Streptokinase.
	oxygen mask and GTN, her chest pain has		
	improved. Her HR=40bpm. ECG shows ST elevation in leads I,	)	
	II, III. What is your next step?		
	a. LMWH		
	b. Streptokinase		
	c. Angiography		
	d. Continue current management		
	e. None		
36.	409. A 29yo lady came to the ED with complaints of		The key is D. External and internal
	palpitations that have been there for the past 4 days and also		oblique muscles.
	feeling warmer than usual. Exam: HR=154bpm, irregular		
	rhythm. What is the tx for her condition?		
	a. Amiadarone		
	b. Beta blockers		
	c. Adenosine		
	d. Verapamil		
	e. Flecainide		
37.	412. A 45yo man who is diabetic and HTN but poorly		The key is B. Pericarditis. [Nature of
1	compliant has chronic SOB, develops severe SOB and chest		pain i.e. sharp pain increased by
	pain. Pain is sharp, increased by breathing and relieved by		breathing and relieved by sitting
	sitting forward. What is the single most appropriate dx?		forward is suggestive of pericarditis].
	a. MI		Nature of pericardial pain: the most
	b. Pericarditis	$\Lambda$	common symptom is sharp, stabbing
	c. Lung cancer		chest pain behind the sternum or in the
	d. Good pastures syndrome		left side of your chest. However, some
	e. Progressive massive fibrosis		people with acute pericarditis describe
			their chest pain as dull, achy or
			pressure-like instead, and of varying
			intensity.
		<u> </u>	intensity.

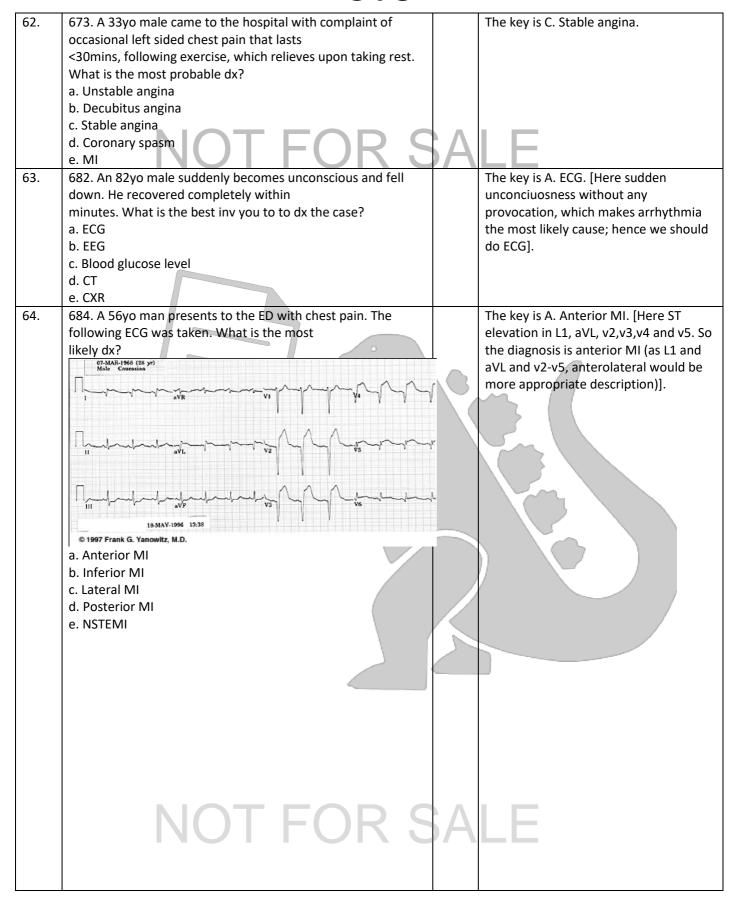

38.	418. A 50yo lady presents to ED with sudden severe chest		The pain of acute pericarditis may radiate to your left shoulder and neck. It often intensifies when you cough, lie down or inhale deeply. Sitting up and leaning forward can often ease the pain.  The key is B. Aortic dissection. [Cold
	pain radiating to both shoulder and accompanying SOB. Exam: cold peripheries and paraparesis.  What is the single most appropriate dx?  a. MI b. Aortic dissection c. Pulmonary embolism d. Good pastures syndrome e. Motor neuron disease	SA	peripheries due to reduced blood flow to dista parts of dissection and reduced perfusion of nerves resulted in paraparesis. Usual management for type A dissection is surgery and for type B is conservative].
39.	424. A 28yo man presents with rapid pounding in the chest. He is completely conscious throughout. The ECG was taken (SVT). What is the 1st med to be used to manage this condition? a. Amiodarone b. Adenosine c. Lidocaine d. Verapamil e. Metoprolol	0	The key is B. Adenosine. [Management of SVT: i) vagal manoeuvres (carotid sinus message, valsalva manoeuvre) transiently increase AV-block, and unmask the underlying atrial rhythm. If unsuccessful then the first medicine used in SVT is adenosine, which causes transient AV block and works by i) transiently slowing ventricles to show the underlying atrial rhythm ii) cardioverting a junctional tachycardia to sinus rhythm. OHCM].
40.	439. A 72yo man is found to be not breathing in the CCU with the following rhythm. What is the most likely dx?   A SVT  b. VT  c. VF  d. Atrial fib  e. Atrial flutter		The key is C. VF.
41.	454. A 65yo male presents with dyspnea and palpitations.  Exam: pulse=170bpm, BP=120/80mmHg. Carotid massage has been done as first instance. What is the next step of the management?  a. Adenosine b. Amlodipine c. DC cardioversion d. Lidocaine e. Beta blocker	\$A	The key is A. Adenosine. [The likely diagnosis is SVT. 1st vagal manoeuvres, if fails iv adenosine.

42.	498. An ECG of an elderly lady who collapsed in the ED shows rapid ventricular rate of 220bpm, QRS=140ms. What is the most probable dx?  a. Atrial fibrillation b. VT c. SVT d. Mobitz type1 2nd degree heart block e. Sinus tachycardia	SA	The key is B. Ventricular tachycardia.  [Dx: i) history (if IHD/MI likelihood of a ventricular arrhythmia is > 95%), ii) 12 lead ECG, and iii) lack of response to IV adenosine). ECG findings in favour of VT:  Positive QRS concordance in chest leads Marked left axis deviation AV dissociation (occurs in 25%) or 2:1 or 3:1 AV block Fusion beats or capture beats OHCM 9 <sup>th</sup> edition, page 816]. [In the given case collapse, ventricular rate of 220 and broad QRS of 140ms points towards VT].
43.	504. A 58yo T1DM on anti-HTN therapy for 13yrs developed central chest pain for 45 mins while driving a/w cold sweating and dyspnea. What is the single most appropriate dx?  a. MI b. Pericarditis c. Pulmonary embolism d. Costochondritis e. Pneumothorax		The key is A. MI. [In pericarditis pain is aggravated by inspiration or lying flat and relieved by leaning forward. Pericardial rub may present and there may be fever. In pneumothorax pain is not central but pleuritic. Pulmonary embolism=dyspnoea and pleuritic chest pain. In costrochondritis localized pain/tenderness at the costochondral junction enhanced by motion, coughing, or sneezing. The given picture of central chest pain for 45 minutes (more than 30 minutes), sweating and dyspnoea with major risk factor of DM and Htn suggest the diagnosis of MI].
44.	505. A man was brought to the ED from a shopping mall after collapsing there. He is conscious and answering questions now. His ECG shows irregular rhythm. Your choice of inv: a. CT b. MRI c. 24h ECG d. Echo		The key is D. Echo. [Echo may show clot in atrial appendage responsible for this attack of TIA secondary to atrial fibrillation].
45.	510. A 45yo manual worker presented with a 2h hx of chest pain radiating to his left arm. His ECG is normal. What is the single most appropriate inv?  a. Cardiac enzymes  b. CXR  c. CT  d. ECG  e. V/Q scan	A	A. Cardiac enzymes.

46.	520. A 50yo man with DM suddenly develops persistent crushing central chest pain radiating to the neck. What is the single most appropriate dx?  a. Angina b. Costochondritis (tietz's disease) c. Dissecting aneurysm d. MI e. Pulmonary embolism	A	The key is C. Dissecting aortic aneurism. Probably wrong key. Correct key should be D. MI. [The features described is insufficient and can be seen in both aortic dissection and MI. However dissection pain is described as tearing and crushing pain is often used for mi pain. Both dissection and mi can have pain radiation to neck. History of diabetes goes with mi as it is a recognized risk factor for mi. Some may argue in DM mi will be painless! But it is not always the case. MI is only painless when autonomic neuropathy becomes well established].
47.	561. A 48yo presents with severe chest pain since the last 40mins. In the ED he is given oxygen, GTN, morphine. ECG=ST elevation. Bloods=increased troponin levels. What is the next step of management?  a. Beta blockers b. Percutaneous angiography c. Anticoagulant & heparin d. Clopidogrel e. Aspirin	S	The key is B. Percutaneous angiography. This is a wrong key! Correct key is E. Aspirin. [In any case of IHD, most important initial management is aspirin].
48.	578. A 65yo man with HTN develops gingival hyperplasia. What is the single most likely dx? a. ACEi b. Beta blockers c. Crohns disease d. Nifedipine e. Sarcoidosis		The key is D. Nifedipine. [Gingival hyperplasia is a recognized side effect of calcium channel blockers].
49.	579. A 65yo woman is undergoing coronary angiography. What measure will protect her kidneys from contrast? a. Furosemide b. Dextrose c. 0.45% saline d. 0.9% saline		The key is D. 0.9% saline.
50.	598. A 72yo woman who is taking loop diuretics is suffering from palpitations and muscle weakness. What is the electrolyte imbalance found?  a. Na+ 130mmol/l, K+ 2.5mmol/l  b. Na+ 130mmol/l, K+ 5.5mmol/l  c. Na+ 140mmol/l, K+ 4.5mmol/l  d. Na+ 150mmol/l, K+ 3.5mmol/l  e. None	A	The key is A. Na+ 130mmol/l, K+ 2.5mmol/l. [Loop diuretic causes hypokalemia and hyponatremia].

51.	603. A 53yo had a dental extraction after which he recently		The key is D. Infection. [Infective
	had a mitral valve prolapse, high temp of 39C, cardiac failure		endocarditis].
	and new cardiac murmur. What is the single most likely dx?		
	a. Atheroma		
	b. Congenital		
	c. Regeneration		
	d. Infection		
	e. Neoplastic		
52.	607. A 46yo African-Caribbean man is found to have		The key is E. CCB. [If age less than 55
	BP=160/90mmHg on 3 separate occasions. What is the best		years but Afro-Caribbean origin then
	initial tx?		CCB].
	a. ACEi		
	b. Beta-blockers		
	c. ARBs		
	d. None		
	e. CCB		
53.	611. A 68yo lady complains of falls to the ground without any		The key is D. Drop attacks. [Drop
	warning, maintains consciousness and no confusion. She says		attacks are sudden spontaneous falls
	this has occurred at number of times. What is the dx?	1	while standing or walking, with
	a. Stokes Adams attack		complete recovery in seconds or
	b. Hypoglycemia		minutes. There is usually no recognized
	c. Vasovagal syncope	13	loss of consciousness, and the event is
	d. Drop attacks		remembered].
	e. Epilepsy		\$ 1 ( )
54.	615. A 45yo man had recently started taking anti-HTN		The key is B. Bendroflumethiazide. [High
	therapy. 6m later his RBS=14mmol/l. Which single drug is		blood sugar is a well known side effect
	most likely to have caused this?		of bendroflumethiazide].
	a. Amlodipine		
	b. Bendroflumethiazide		
	c. Doxazosin		
	d. Lorsartan		
	e. Ramipril		
55.	630. A 43yo lady is admitted with pyrexia, arthropathy,		The key is D. [Pyrexia, arthropathy,
	breathlessness and syncope. She was recently dx with		breathlessness, syncope and early
	pulmonary emboli. There is an early diastolic sound and a		diastolic sound and a mid diastolic
	mid-diastolic rumble. Her JVP is elevated with prominent a-		rumble are known features of atrial
	waves. What is the most likely cause?		myxoma].
	a. Mitral regurgitation		
	b. Ventricular ectopics		
	c. Pulmonary regurgitation		
	d. Atrial myxoma		
	e. Complete heart block		
56.	636. A 60yo lady has severe chest pain. ECG shows changes of		The key is D. Mobitz type I 2 <sup>nd</sup> degree
	inferior wall MI. ECG also shows progressive prolongation of	1	heart block. [Inferior MI is frequently
	PR interval until a QRS complex is dropped. What is the most		associated with conduction defect].
	probable dx?	1	assessated than considering derectj.
	a. Atrial fibrillation	Λ 4	
	b. VT	A	
	c. SVT	<b>7</b> / <b>1</b>	
	d. Mobitz type I 2nd degree heart block	1	
	e. Mobitz type II 2nd degree heart block		
	e. Moditz type ii ziiu uegree nedit biotk	<u> </u>	

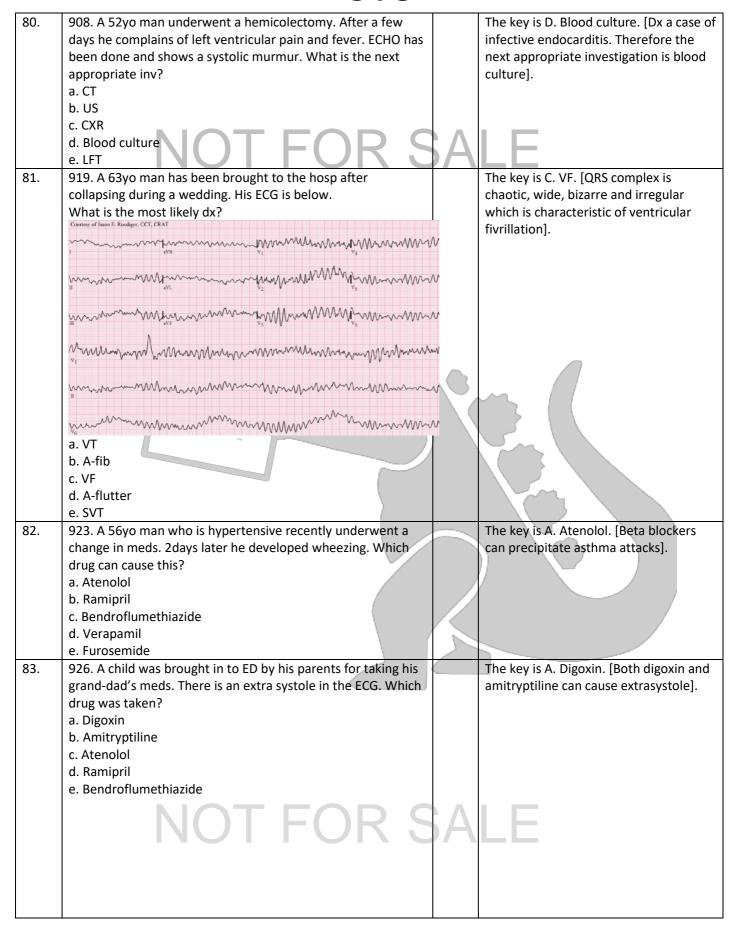

57.	645. A 56yo man was recently put on anti-HTN meds and recent biochemistry on 2 occasions showed: Na+=132, K+=7.6, Urea=11.3, Creat=112. Which of the following drugs is responsible for this result?  a. Amlodipine  b. Bendroflumethiazide		The key is E. Ramipril. [ACEI and ARB are known to raise the serum potassium level].
	c. Doxazosin d. Atenolol e. Ramipril	A	LE
58.	660. A 63yo man continues to experience chest pain and has a temp of 37.8C 2 days after an acute MI. His ECG shows widespread ST elevation with upward concavity. What is the single most likely explanation for the abnormal inv?  a. Acute pericarditis b. Cardiac tamponade c. Atrial thrombus d. Left ventricular aneurysm e. Dressler syndrome		The key is A. Acute pericarditis. [Chest pain, raised temperature and ECG findings of widespread ST elevation with upwards concavity is diagnostic of acute pericarditis particularly after MI].
59.	665. A 79yo woman has been dx with T2DM. Her BMI=22. RBS are 8 and 10mmol/l. Her BP=130/80mmHg. Her fasting cholesterol=5.7mmol/l. She is currently symptom-free but has microalbuminuria. What is the single most appropriate drug management?  a. ACEi and glibenclamide b. ACEi and metformin c. Statin and ACEi d. Statin and glibenclamide e. Statin and metformin	0	The key is C. Statin and ACEi. [Diabetic patients are advocated statin irrespective of cholesterol levels and diabetic microalbuminuria is best treated by ACEI. As initially we shall give lifestyle advice and no medicine for diabetes even then we shall start with statin and ACEI].
60.	670. A 55yo man returns for routine follow up 6wks after an MI. He gets breathless when walking uphill. His ECG shows ST elevation in leads V1, V2, V3 and V4. What is the single most likely explanation for the abnormal investigation?  a. Heart block b. Right ventricular strain c. Atrial thrombus d. Left ventricular aneurysm e. Dressler's syndrome		The key is D. Left ventricular aneurism. [Features of heart failure and persistent ST elevation suggests the dx of left ventricular aneurysm].
61.	672. A 76yo man suddenly collapsed and died. At post mortem exam, a retroperitoneal hematoma due to ruptured aortic aneurysm was noted. What is the most likely underlying cause of the aortic aneurysm?  a. Atheroma b. Cystic medial necrosis c. Dissecting aneurysm d. Polyarteritis nodosa e. Syphilis	A	The key is A. Atheroma.

65.	697. A 72yo man presents to the ED with chest pain. The		The key is B. Inferior MI. [There is
	following ECG was taken What is the most		pathological Q wave and mild ST
	likely dx?		elevation in leads II, III and aVF].
		A	LE
	a. Anterior MI		
	b. Inferior MI		
	c. Lateral MI		
	d. Posterior MI		
	e. NSTEMI		
66.	708. A 46yo woman has weight gain, sensitivity to cold,		The key is A. Hypothyroidism. [The
	pulse=50bpm, heart is enlarged with murmur.		given symptoms are classic presentation
	What is the single most likely dx?	13	of hypothyroidism].
	a. Hypothyroidism		
	b. Hyperthyroidism		<b>\</b>
	c. Cushing's syndrome		
	d. Addison's disease11		
	e. Pheochromocytoma		
67.	712. A 60yo man has had spontaneous painful swelling of his		
	right knee for 3days. 5days prv he had an inguinal hernia		
	repaired as a day case. He takes bendroflumethiazide 2.5mg		
	daily. He is apyrexial. What is the single most appropriate		
	diagnostic inv?		The key is E. Serum uric acid. [Thiazide
	a. Blood culture		diuretics causes hyperuicemia which
	b. CRP	//	can precipitate acute attack of gout].
	c. D-dimer		
	d. XR knee		
	e. Serum uric acid		
68.	724. A pt on HTN drugs develops hyperkalemia. Which anti-		The key is A. Ramipril. [Both ramipril
	HTN is likely to cause it?		and losartan can cause hyperkalemia].
	a. Ramipril		
	b. Lorsartan		
	c. Thiazide		
	d. Nifedipine		
	e. Furosemide		
69.	740. A 25yo man presents with hx of breathlessness. A		The key is B. Bubble echo. [Bubble echo
	transthoracic echo reveals a patent foramen ovale. What		is actually extension of
	diagnostic inv would you do for a patent foramen ovale?	Λ 4	transoesophageal echo in that here
	a. Transesophageal echo	A	additional bubbles are added during
	b. Bubble echo	/ <b>\</b>	transoesophageal echo to get better
	c. Transthoracic echo		visualization of foramen ovale].
	d. ECG		
	I	l	

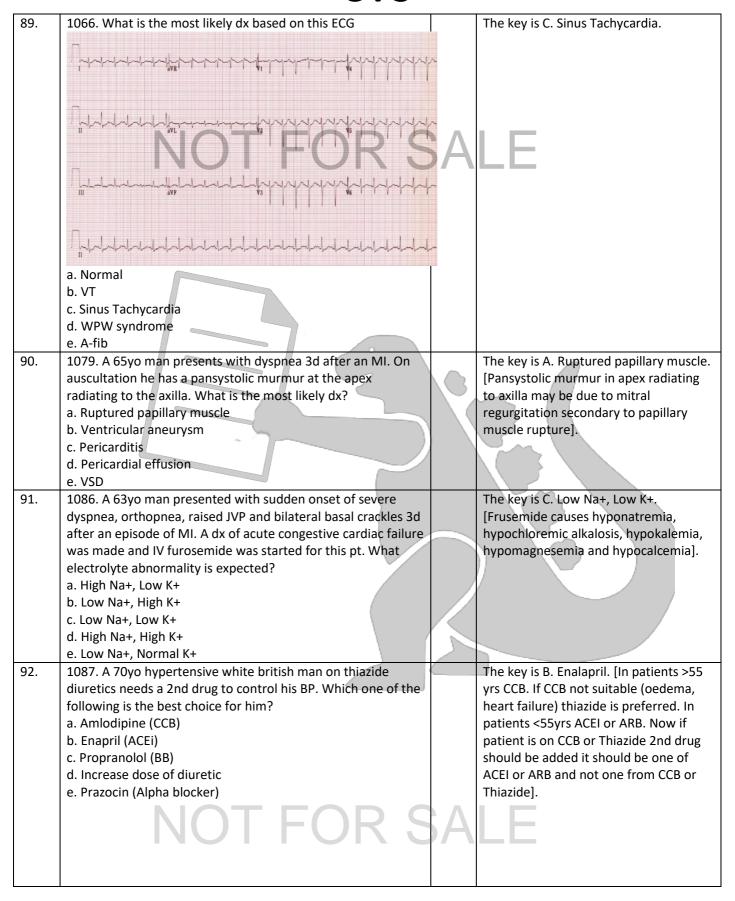

70.	748. The body of a 65yo man who was treated for TB and bronchitis was seen at autopsy. His legs were swollen and his liver showed signs of a transudate fluid. What was the cause of the transudate?  a. Liver cirrhosis  b. Alcoholic liver disease  c. Cardiac failure		The key is C. Cardiac failure.
	d. Budd-chiari syndrome e. TB	A	LE
71.	756. A woman presents with hx of falls, becomes pale and clumsy. She is hypertensive and takes atenolol, bendroflumethiazide and amlodipine. What inv is needed? a. 24h ECG b. 24h BP monitoring c. ECG d. Echo e. CT head		The key is B. 24h BP monitoring. [All these drugs (particularly prolonged use of thiazide and amlodipine) are well established cause of postural hypotension. So 24 hour BP monitoring should be done].
72.	766. A 52yo man with hx of ant MI 3 wks ago developed sudden onset of dyspnea. Exam: BP=100/60mmHg, pulse=100bpm, SaO2=88%, chest=bilateral crackles. Which inv would you do to find the underlying cause? a. CXR b. Echo c. D-dimer d. Radionucleotide lung scan e. Troponin	3	The key is A. CXR. It is wrong key. Correct key should be B. Echo. [The question does not want to know the features of pulmonary oedema rather it is clearly mentioned "which investigation would you do to find out the UNDERLYING CAUSE". As in this patient sudden papillary muscle rupture or VSD may be the likely cause (ventricular aneurism may take a more slower course) so echo seems to be more logical approach].
73.	776. A 68yo man with DM and HTN was noted to have cholesterol level of 3.4mmol/l. he was also noted to have microalbuminuria. What is the best drug to add to his regimen?  a. ACEi b. Statin c. Amlodipine d. Biguanides		The key is A. ACEI. [ACEI is renoprotective and prevents progress in albuminuria].
74.	801. A 78yo gentleman suddenly collapsed. His HR=120bpm, BP=70/40mmHg. Exam: pulsatile mass in abdomen. What is the most appropriate dx?  a. Aortic aneurysm  b. Mesenteric cyst  c. Umbilical hernia		The key is A. Aortic aneurism. [There is features of shock with pulse 120bpm and bp 70/40mmHg and sudden collapse of the patient with pulsatile mass in abdomen makes the likely diagnosis of ruptured aortic aneurism].
75.	817. A 48yo man has continuous ant chest pain which is worse on inspiration and has temp of 37.5C since 4wks after a MI. His ESR=45mm/h. What is the single most likely explanation for the abnormal inv?  a. Acute pericarditis b. Cardiac tamponade c. Atrial thrombus d. Left ventricular aneurysm e. Dressler syndrome	SA	The key is E. Dressler syndrome. [Dressler syndrome usually occurring two to five weeks after the initial event but it can be delayed for as long as three months. It is characterised by pleuritic chest pain, low-grade fever and pericarditis].

76.	836. A 70yo woman with longstanding anxiety is seen in the OPD. She complains of her heart skipping a beat quite often. This particularly occurs when she is trying to get to sleep. The palpitations are never sustained. What is the most likely rhythm disturbance?  a. SVT b. VF c. VT d. V-ectopics e. A-fib	SA	The key is D. V-ectopics. [From the given options the most likely answer is V-ectopics. If it occurs in a normal heart though symptomatic it is benign in nature but if it is secondary to heart disease like MI it may precipitate to more life threatening arrhythmia like ventricular fibrillation].
77.	876. A 60yo is on tx for IHD, HTN and hyperlipidemia. During the night he complains of wheeze and SOB. Which of the following meds is responsible for that?  a. Amlodipine b. Atenolol c. Ramipril d. Simvastatin e. Bendroflumethiazide		The key is B. Atenolol. [Asthma can be precipitated by beta blockers].
78.	890. A 29yo man was involved in an RTA. He presents with distended neck veins, clear breath sounds and a trachea which is in the midline. His RR=34bpm, BP=60/0mmHg. What is the most likely dx?  a. Simple pneumothorax b. Tension pneumothorax c. Cardiac tamponade d. Pericarditis	0	The key is C. Cardiac tamponade. [Distended neck vein, clear breath sound and no tracheal shift and BP of 60/0 points towards cardiac tamponade].
79.	894. A 50yo man presented with increased breathlessness at rest. He is currently on furosemide, digoxin and isosorbide mononitrate. What drug is going to help him?  a. Ramipril  b. Bendroflumethiazide  c. Atenolol  d. Amlodipine  e. Diltiazem	A	The key is B. Bendroflumethiazide. [This is a case of diuretic resistance. Heart failure represents the most common clinical situation in which diuretic resistance is observed. In mild CHF, diuretic resistance is not commonly encountered, as long as renal function is preserved. However, in moderate and severe CHF patients, diuretic resistance occurs more frequently and often becomes a clinical problem. In diuretic resistance another diuretic is added to get optimal or desirable result. As patient is still in heart failure and pulmonary edema with the usage of loop diuretica thiazide diuretic could be added with loop when response is inadequate. This will reduce the volume overload and improve breathing].

84.	928. A HTN pt on bendroflumethiazide 2.5mg/d has come for his routine checkup. Exam: BP=145/85mmHg. Lab: K+=5.9, Na+=137. What is the most appropriate management for this pt?  a. Stop meds b. Continue same dose c. Increase the dose d. Decrease the dose e. Repeat the blood test	A	The key is E. Repeat the blood test. [Bendroflumethiazide causes hyponatremia and hypokalemia. But the findings are opposite which is probably error of test. Hence blood test should be repeated to confirm the level of potassium and sodium].
85.	937. A 57yo man having HTN on oral anti-HTN. However, he is finding it difficult to mobilize as he feels dizzy whenever he tries to get up. What is the most appropriate inv for him?  a. Ambulatory BP  b. ECG  c. MRI  d. CXR  e. CT		The key is A. Ambulatory BP. [Ambulatory BP to document low BP as cause of presenting symptom. The case seems to be of postural hypotension and low BP as a result of given anti hypertensive].
86.	982. A 50yo female had swelling in her ankles. She is a known alcoholic. Now she presented with breathlessness and palpitations. What is the most likely cause of her condition?  a. VT  b. SVT  c. A-flutter  d. A-fib  e. V-ectopics	0	The key is D. Atrial fibrillation. [Ankle swelling suggests alcoholic cardiomyopathy and alcoholism is also a well known cause of atrial fibrillation].
87.	1027. A 80yo man with prostatic cancer has confusion, thirst, abdominal pain and an abnormal ECG. What is the most appropriate inv? a. MRI spine b. Radionuclide bone scan c. DEXA scan d. Serum ALP concentration e. Serum calcium concentration		The key is E. Serum calcium concentration. [Confusion, thirst, abdominal pain and ECG changes (marked shortening of QT interval) are features of hypercalcemia. So E. Serum calcium concentration is the likely option].
88.	1053. A 42yo lady had corrective surgery for cyanotic congenital heart disease at the age of 3y, after a palliative operation during infancy. There is a parasternal impulse and an early diastolic murmur.  What is the most probable dx?  a. Aortic regurgitation b. Ischemic mitral regurgitation c. Aortic stenosis d. Pulmonary stenosis e. Pulmonary regurgitation		The key is E. Pulmonary regurgitation. [In the present day, some patients with tetralogy of Fallot have survived for longer than 15-20 years after their first operation. The major problem encountered by these individuals is the development of pulmonary valvular regurgitation. It appears that a number of these individuals require pulmonary valve replacement (ref: Medscape)].

	a. SVT b. V-fib	ьД	
	c. VT	// \	
	d. V-ectopics e. A-fib		

114.	1415. A pt is on loop diuretics. What effect do loop diuretics produce?  a. Low Na+, low K+  b. Low Na+, normal K+  c. Normal Na+, normal K+  d. High Na+, low K+  e. High Na+, high K+  1417. A 76yo man is in the CCU 2d after an acute MI. He tells you that he had an episode of rapid pounding in the chest lasting for about 2mins. He remains conscious throughout. What is the most likely rhythm?  a. SVT  b. VF  c. VT	A	The key is A. Low Na+, Low K+. [Loop diuretics causes hyponatremia and hypokalemia].  The key is C. VT. It is wrong key. Correct key should be D. V-ectopics. [Ref: OHCM]
116.	d. V-ectopics e. A-fib  1446. A 54yo man comes with sudden onset of palpitations and breathlessness. His HR=164bpm. What is the single most appropriate tx in the acute phase? a. Adenosine b. Metaprolol c. Verapamil d. Amiodarone	(3)	The key is A. Adenosine. [Common arrhythmias we encounter are AF, SVT, VT in exams. Here no suggestive feature for AF and SVT is the commonest presentation as in described case. So first we shall give adenosine to establish the diagnosis].
117.	1494. A 72yo woman who is taking loop diuretics for left ventricular failure. She now is suffering from palpitations and muscle weakness. What is the electrolyte imbalance found?  a. Na+=130mmol/L, K+=2.5mmol/L b. Na+=130mmol/L, K+=5.5mmol/L c. Na+=140mmol/L, K+=4.5mmol/L d. Na+=150mmol/L, K+=3.5mmol/L e. None		The key is A. Na+=130mmol/L, K+=2.5mmol/L. [Loop diuretics causes hyponatremia and hypokalemia].
118.	1505. A pt came to the hosp with a complaint of severe chest pain lasting for >1h. Following ECG test, pt revealed to have ST depression. He was already on aspirin. What is the most specific tx for this pt? a. GTN b. Simvastatin c. Clopidogrel d. BB e. LMWH		The key is B. Simvastatin. It is a wrong key. Correct key should be LMWH.  [Specific treatment means treatment particularly adapted to the special disease being treated. LMWH is vital to prevent further events or deterioration and seems to be the most specific drug in the given scenario].
119.	1527. The ECG of a 65yo shows absent P waves, narrow QRS complex, ventricular rate of 120bpm and irregular R-R interval. What is the most probable dx?  a. A-fib b. A-flutter c. SVT d. Mobitz type 1 2nd degree heart block e. Sinus tachycardia	\$A	The key ia A. Atrial fibrillation. [In Afibrillation fibrillatory f waves replaces p waves and R – R interval are irregular].

120.	1528. The ECG of an 80yo pt of IHD shows sawtooth like waves, QRS complex of 80ms, ventricular rate of 150bpm and regular R-R interval. What is the most probable dx?		The key is B. Atrial flutter. [Sawtoothlike waves and regular R-R interval are diagnostic of atrial flutter].
	a. A-fib b. A-flutter		
	c. SVT d. Mobitz type 1 2nd degree heart block		
	e. Sinus tachycardia	Λ	
121.	1549. A 55yo woman suffered from an acute MI 5d ago. While		The key is B. Ruptured papillary muscle.
	she was in the hosp the pt developed features of pulmonary		[Post MI rupture of papillary muscl is
	edema and heart failure. What is the most probable cause of		responsible for valve failure (mitral
	her present condition?		regurgitation) causing pulmonary
	a. VSD b. Ruptured papillary muscle		oedema and heart failure].
	c. Pericarditis		
	d. A-fib		
	e. Re-infarction

	itching. Exam: linear tracks on the wrist. She says that 2d		probable diagnosis is scabies in which
	ago she had come in contact with a nursing home inmate		there is itching due to allergic reaction to
	with similar symptoms.	J	mites (Sarcoptes scabii) waste products].
	What is the mechanism of itching?		
	a. Infection		
	b. Destruction of keratinocytes		
	c. Allergic reaction		
	d. Immunosuppression		
	e. None		
12.	725. A young man develops itching worse at night and		The key is A. Scabies.
	following bathing. Exam: greysish white linear rash can be		
	seen on the wrist and periumbilical area. What is the dx?		
	a. Scabies		
	b. Polycythemia		
	c. Urticarial		
	d. Atopic eczema		
	e. Lichen planus		
13.	838. A 12yo boy presented with itching in his hands.		The key is C. Eczema. [Itchy lesion and
	Exam: skin is dry and red. His mother is		family history of asthma and hay fever in
	asthmatic and older brother has hay fever. What is the		1 <sup>st</sup> degree relatives favours the diagnosis
	single most likely causative factor?		of eczema].
	a. Dermatitis herpitiformis		
	b. Scabies		
	c. Eczema		DALE
	d. Uremia		
	e. Drug induced		

14.	839. A 45yo man presented with pruritic purple papules on the flexor surface of his wrist and some white lacy markings on his buccal mucosa. What is the single most likely causative factor?  a. ALL b. Lymphoma c. Polycythemia d. IDA e. Lichen planus	The key is E. Lichen planus. [White lacy pattern of lesion is characteristic of lichen planus].
15.	1092. A 9yo child presented with a rash on his skin which didn't respond to antibacterial ointment. What med should be added next? a. Corticosteroid b. Antifungal c. Emollient d. Permethrin e. Coal tar	The key is B. Antifungal.
L6.	1330. A young child dx with chicken pox. Usually goes to day care. What is the most appropriate advice?  a. Child should be admitted to hospital straight away b. Isolate the child from parents and siblings at home c. Advice that he can go back to nursery when the rash is crusted over	The key is C. Advice that he can go back to nursery when the rash is crusted over. [At this stage patient is no more infectious].
L7.	1331. A 7yo boy is brought by his mother. There are multiple perioral and forehead vesicles. Some vesicles are crusted and some are not. The face is hot. What is the most likely dx? a. Varicella zoster b. Herpes zoster c. Fungal infection d. Impetigo e. Psoriasis	The key is B. Herpes zoster.
18.	1447. A 29yo woman has developed an itchy scaly rash particularly over her wrist with fine white streaks overlying the lesion. Her nails have ridges and her buccal mucosa is lined with a lacy white pattern. What is the single most likely dx?  a. Psoriasis b. Scabies c. Urtericaria d. Dermatitis herpetiformis e. Hyperthyroidism f. Lichen planus	The key is F. Lichen planus. ["Lacy white pattern" is used as a diagnostic description of lichenplanus].

L9.	1655. A 37yo female working as a healthcare assistant in	Key is A: allergic reaction
	a nursing home comes to the ED with	A severe allergic reaction
	complaints of severe itching all over her body. On asking	(anaphylaxis) will affect the whole body; in
	she replies that she had applied cream	susceptible individuals it may develop
	on the body of a resident in the nursing home who had	within seconds or minutes of contact with
	similar itches. What is the mechanism of	
		the trigger factor and is potentially fatal.
	itching?	Possible triggers can include skin or
	a. Allergic reaction	airborne contact with particular materials,
	b. Inflammation of keratinocytes	the injection of a specific drug, the sting of
	c. Allergic reaction developed due to use of topical	a certain insect or the ingestion of a food
	steroid creams	such as peanuts
	d. Subcutaneous bleeding	
	e. None	
20.	1660. A 17-year-old boy is diagnosed with scabies. Which	Key is C: It causes itchiness in the skin even
	of the following statements regarding	where there is no obvious lesion to be
	scabies is correct?	seen
	a. Is best treated by salicylate emulsion	Excluded Points:
	b. It can be spread by a droplet infection	a. The usual scabies treatment is with
	c. It causes itchiness in the skin even where there is no	permethrin cream. Permethrin is an
	obvious lesion to be seen	insecticide that kills the mites
	d. It is caused by Staphylococcus aureus	b. You need close skin-to-skin contact with
	e. Typically affects the face	an infected person to catch scabies. This is
	e. Typically affects the face	
	- 7	because the scabies mite cannot jump or
		fly
		d. Scabies is caused by a mite (like a tiny
		insect) called Sarcoptesscablei. The mite is
		a parasite, meaning it lives off the host (a
		human) with no benefit to the host
		e. Itching is often severe and tends to be
		in one place at first (often the hands)
		Scabies:
		Scabies is caused by a mite (like a
		tiny insect) called Sarcoptesscabiei. The
		mite is a parasite, meaning it lives off the
	\	host (a human) with no benefit to the
		host.
		Scabies is common. In the UK, about
		1 in 1,000 people develop scabies each
		month. Scabies is more common in town
		(urban) areas, in women and children, in
		the winter, and in the North of the
		<ul><li>country.</li><li>The skin-to-skin contact needs to be</li></ul>
	NOTEOD	
	NOTFOR	for a reasonable time to catch the mite.
		You usually need to be in skin contact for
		15-20 minutes to catch scabies.
		Scabies symptoms usually take 2-6
		weeks to occur after you are first
		Treatment:

	NOT FOR	Scabies can stay in your skin for ever if not treated. Treatment is needed for:  • Anybody who has scabies; AND  • All household members, close contacts, and sleeping/sexual partners of the affected person - even if they have no symptoms. This is because it can take up to six weeks to develop symptoms after you become infected. Close contacts may be infected, but have no symptoms, and may pass on the mite.  • Apply 5% permethrin over whole body including scalp, face (avoid eyes), neck and ears. Do not forget the soles; wash off after 8-12 h, repeat after 7 days.
21.	1667. A 58yo man complains of nose disfigurement. He has a hx of facial erythema particularly of the cheeks and nose. Papules and pustules have been erupting at intervals over the last 10yrs. He admits to a moderate regular consumption of alcohol. Exam: noted to have rhinophyma. The most likely dx is?  a. Eczema b. Herpes simplex c. Epidermolysis bullosa d. Dermatomyositis e. Tinea versicolor f. Pemphigus vulgaris g. Acne rosacea h. Malignant melanoma i. Psoriasis	The key is G, Acne Rosacea
22.	j. Atopic dermatitis  1669. A pt has fine nail pitting, small yellow-brown areas of discoloration in the nailbed involving the nails on both hands. These findings a re commonly associated with?  a. Yellow nail syndrome  b. Leukonychia c. Onychomycosis d. Lichen planus e. Pellagra f. Thallium toxicity g. Contact dermatitis h. Zinc deficiency i. Hypoalbuminemia j. Psoriasis	Ans: Psoriasis Characteristic nail changes include pitting, discolouration, subungual hyperkeratosis, crumbling of the nail plate, and onycholysis. Oil drop or salmon patch: translucent yellow-red discoloration in the nail bed. Leukonychia: areas of white nail plate due to foci of parakeratosis within the body of the nail plate.

27.	754. A young lady after a heavy bout of drinking last night comes to the ED with dizziness, abdominal pain, vomiting blood with cool peripheries. After initial resuscitation, oxygen and fluids, she still continues to bleed with pulse=130bpm and BP=85/58mmHg. What would be your next best management?  a. Clotting screen b. US c. CT d. Endoscopy e. Omeprazole	)F	The key is D. Endoscopy. [In young it is unlikely to get oesophageal varices rather than the bleeding is from probable gastric erosion and endoscopy should be done (diagnostic and therapeutic- like sclerotherapy].
28.	775. A middle aged male is feeling unwell after		A. Calcium gluconate. [ECG change of prolonged QRS
	a recent MI. The recent ECG shows prolonged QRS complex and tented T wave. Na+=136mmol/I, K+=6.2mmol/I, urea=5mmol/I. What is the most appropriate management? a. Calcium gluconate b. Calcium resonium c. Calcium with vit D supplement	•	complex and tented T wave are suggestive of hyperkalaemia which is further supported by K+ level of 6.2 mmol/l. So to protect the heart from arrhythmia calcium gluconate should be given].
	d. Vit D	7	
29.	e. Calcium 777. A child playing with toys suddenly		The key is A. Laryngoscopy. [Breathlessness and stridor in a
	develops breathlessness and stridor. Which inv will lead to the dx? a. Laryngoscopy b. CXR c. Peak flow meter d. ABG		child playing with toy is most likely due to aspiration of foreign body (toy or part of toy) for which laryngoscopy should be done].
30.	784. A 2yo girl prv well presents with a hx of vomiting and diarrhea for 4hrs. What is the most suitable indication for IV fluid administration? a. Capillary refill time >4s b. HR >90bpm c. Increased RR d. Stool >10x/d e. Weight of child = 10kgs		The key is A. Capillary refill time >4s. [Capillary refill time >4s is sign of severe dehydration indicating need for IV fluid administration. Features of severe dehydration: i) abnormally sleepy or lethargic ii) sunken eyes iii) drinking poorly or not at all iv) reduced skin turgr > 2 seconds v) dry tongue and mucous membrane vi) absent tears vii) oliguria viii) hypotension ix) tachycardia x) prolonged capillary refill time xi) depressed anterior frontanelle].
31.	788. A 77yo woman suffered diarrhea 4d ago. What would be her blood gas result?		The key is B. pH = 7.4, PaCO2 = 1.5
	a. pH =7.2, PaCO2 =8 b. pH =7.4, PaCO2 =1.5 c. pH =7.4, PaCO2 =2.6 d. pH =7.4, PaCO2 =2.8		
32.	789. A man presents with abdominal pain, vomiting, pulse=120bpm, BP=90/60mmHg and a rigid abdomen. His chest is clear. What is the immediate management? a. Call radiology b. Admit to medical ward c. Urgent admission to ITU (Intensive Therapy Unit)	)F	The key is C. Urgent admission to ITU.

33.	796. A 34yo man was involved in a RTA and		The key is 100% oxygen.
	whilst in the ambulance his GCS deteriorated		
	and RR increased from 30-48. What is the most		
	appropriate management for this pt?		
	a. IV fluid		
	b. Needle thoracocentesis		
	c. 100% oxygen		
	d. Portable XR		
24	804. A 40yo man complains of thirst and	7	The key is A. IV fluids. [Hypercalcemia is treated by IV
34.			
	lethargy. His BP=140/90mmHg, corrected		fluids].
	Ca2+=3.7mmol/l. What is the most appropriate		
	management at this stage?		
	a. IV fluids		
	b. Prednisolone		
	c. IV hydrocortisone		
	d. Calcium prep		
35.	826. A young girl who is known to have T1DM		The key is E ABG. [Likely diagnosis is DKA where ABG is
	presented with drowsiness and deep breathing.		done to demonstrate acidosis].
	Her sugar level=20. Her BP=120/80mmHg and	2	
	her mucous membranes are dry. What would	0	
	be the next appropriate step?	-7	
	a. Serum urea		
	b. Blood culture		
	c. CT		
	d. HbA1c		
	e. ABG		
36.	840. A known DM was admitted with sudden		The key is B. RBS. [In unconsciousness in diabetics, first
	LOC. What is the initial inv?		hypoglycemia should be excluded by doing RBS].
	a. CT scan		mypogrycering should be excluded by doing hoof.
	a. CT scan b. RBS		mypogrycering should be extended by doining hooji.
	b. RBS		mypogrycenia silosia s

#	QUESTIONS	DR. KHALID'S EXPLANATION	OLD KEYS
1.	51. A 5yo girl had earache and some yellowish foul smelling discharge, perforation at the attic and conductive hearing loss. She has no past hx of any ear infections. What is the most appropriate dx?  a. Acute OM b. OM with effusion c. Acquired cholesteatoma d. Congenital cholesteatoma e. Otitis externa	The key is c. Acquired cholesteatoma. [Acquired cholesteatomas develop as a result of chronic middle ear infection and are usually associated with perforation of the tympanic membrane at the attic (mass is seen in attick with perforation at pars flaccida- in contrast to medial to tympanic membrane which is in congenital). Clinical presentation usually consists of conductive hearing loss, often with purulent discharge from the ear].	
2.	81. A 10yo girl presents with hoarseness of the voice.  She is a known case of bronchial asthma and has been on oral steroids for a while. What is the most likely cause of hoarseness?  a. Laryngeal candidiasis b. Infective tonsillitis c. Laryngeal edema d. Allergic drug reaction e. Ludwigs angina	The key is A. Laryngeal candidiasis.  2. Steroids predisposes to fungal infection.	
3.	127. A 30yo man complains of hoarseness of voice. Exam: unilateral immobile vocal cord. What is the most probable dx? a. Graves disease b. Hematoma c. Unilateral recurrent laryngeal nerve injury d. External laryngeal nerve injury e. Tracheomalacia	The key is C. unilateral recurrent laryngeal nerve injury.	
4.	180. A 20yo pop star singer complains of inability to raise the pitch of her voice. She attributes this to the thyroid surgery she underwent a few months back. What is the most likely dx?  a. Thyroid storm  b. Bilateral recurrent laryngeal nerve injury c. Unilateral recurrent laryngeal nerve injury d. External laryngeal nerve injury e. Thyroid cyst	The key is D. External laryngeal nerve injury. [External laryngeal nerve functions to tense the vocal cords by activating the cricothyroid muscle, increasing pitch].	
5.	172. A 44yo pt has sudden onset of breathlessness and stridor few minutes after extubation fo thyroidectomy. The pat had longstanding goiter for which he had the surgery. What is the most likely dx?  a. Thyroid storm  b. Hematoma  c. Unilateral recurrent laryngeal nerve injury  d. External laryngeal nerve injury  e. Tracheomalacia	The key is tracheomalacia. [Prolonged pressure over trachea by goiter is a cause of tracheomalacia following thryroidectomy].	

6.	198. A 60yo pt recovering from a surgery for toxic	The key is B. Reactionary haemorrhage. [in
	goiter is found to be hypotensive, cyanosed in the	the recovery room, cyanosis, hypotension,
	the RR. Exam: tense neck. There is blood oozing from	tense neck, woozing of blood from drain; all
	the drain. What is the most likely dx?	these goes in favour of reactionary
	a. Thyroid storm	haemorrhage].
	b. Reactionary hemorrhage	
	c. Secondary hemorrhage	
	d. Primary hemorrhage	DCALE
	e. Tracheomalacia	RSALE
7.	305. A 10yo boy presents with nose bleed. What	The key is C. Press soft parts of the nose.
	measure should be taken to stop the bleeding?	
	a. Press base of the nose	
	b. Ice packs	
	c. Press soft parts of the nose	
	d. Start tranexemic acid	
	e. IV fluids	
8.	324. A man presents with muffled hearing and feeling	The key is B. Acoustic neuroma.
	of pressure in ear with tinnitus and vertigo. He also	
	complains of double vision when looking to the right.	
	What is the most appropriate dx?	
	a. Meniere's disease	
	b. Acoustic neuroma	
	c. Acute labyrinthytis	
	d. Meningioma	
	e. Otosclerosis	
9.	342. An 8yo returned from Spain with severe pain in	The key is A. Gentamycin topical.

	complains of tinnitus, vertigo and numbness on same	option].
	half of his face. What is the most	
	appropriate inv for his condition?	
	a. Audiometry	
	b. CT	
	c. MRI	
	d. Tympanometry	
	e. Weber's test	
16.	405. A 31yo man has epistaxis 10 days following	The key is A. Nasal infection. [Infection is
	polypectomy. What is the most likely dx?	one of the most important cause of
	a. Nasal infection	secondary hemorrhage].
	b. Coagulation disorder	
	c. Carcinoma	

17.	422. A 5yo child complains of sore throat and earache. He is pyrexial. Exam: tonsils enlarged and hyperemic, exudes pus when pressed upon. What is the single most relevant dx?  a. IM b. Acute follicular tonsillitis c. Scarlet fever d. Agranulocytosis e. Acute OM	The key is B. Acute follicular tonsillitis.  [Tonsillitis is usually caused by a viral infection or, less commonly, a bacterial infection. The given case is a bacterial tonsillitis (probably caused by group A streptococcus). There are four main signs that tonsillitis is caused by a bacterial infection rather than a viral infection. They are:  • a high temperature  • white pus-filled spots on the tonsils  • no cough  • swollen and tender lymph nodes (glands).
18.	449. A young pt is complaining of vertigo whenever she moves sideways on the bed while lying supine. What would be the most appropriate next step?  a. Head roll test b. Reassure c. Advice on posture d. Carotid Doppler e. CT	The key is A. Head roll test. [this is a case of "benign paroxysmal positional vertigo" for which the diagnosis is made by head roll test].
19.	479. A 30yo man presents to the ED with difficulty breathing. He has returned from India. Exam: throat reveals grey membranes on the tonsils and uvula. He has mild pyrexia. What is the single most relevant dx? a. Diphtheria b. IM c. Acute follicular tonsillitis d. Scarlet fever e. Agranulocytosis	The key is A. Diphtheria. [history of travel to india, grey membrane in tonsil and uvula, low grade fever, and dyspnoea support the diagnosis of diphtheria].
20.	495. A 68yo woman has a sudden onset of pain and loss of hearing in her left ear and unsteadiness when walking. There are small lesions visible on her palate and left external auditory meatus.  What is the single most likely dx?  a. Acute mastoiditis b. Cholesteatoma c. Herpes zoster infection d. Oropharyngeal malignancy e. OM with infusion	The key is C. Herpes zoster infection. [Herpes zoster oticus (Ramsay Hunt syndrome) occurs when latent varicalla zoster virus reactivates in the geniculate ganglion of the 7 <sup>th</sup> cranial nerve. Symptoms: Painful vesicular rash on the auditory canal ± on drum, pinna, tongue, palate or iris with ipsilateral facial palsy, loss of taste, vertigo, tinnitus, deafness, dry mouth and eyes. OHCM 9 <sup>th</sup> edition, page 505].

21.	497. A 17yo man has acute pain and earache on the right side of his face. Temp=38.4C and has extensive pre-auricular swelling on the right, tender on palpation bilaterally. What is the single most likely dx?  a. Acute mastoiditis	The key is D. Mumps. [C/F: prodromal malaise, increased temperature, painful parotid swelling, becoming bilateral in 70%. OHCS 9 <sup>th</sup> edition, page 142].
	b. Acute otitis externa c. Acute OM d. Mumps e. OM with effusion	R SALE
22.	503. A 26yo woman has become aware of increasing right sided hearing deficiency since her recent pregnancy. Her eardrums are normal. Her hearing tests show: BC-normal. Weber test lateralizes to the right ear. What is the single most likely dx? a. Encephalopathy b. Functional hearing loss c. Tympano-sclerosis d. Otosclerosis e. Sensorineural deafness	The key is D. Otosclerosis. [There are no features of encephalopathy. As Weber test is lateralized it is unlikely to be functional hearing loss. In tympanosclerosis ear drum becomes chalky white. So as the ear drum is normal it is not tympanosclerosis. Weber test is lateralized to right and deafness is also on the right. So it not sensorineural deafness but conductive deafness which makes otosclerosis as the most likely diagnosis].
23.	544. A 52yo man whose voice became hoarse following thyroid surgery 1 wk ago shows no improvement. Which anatomical site is most likely affected?  a. Bilateral recurrent laryngeal nerve b. Unilateral recurrent laryngeal nerve c. Unilateral external laryngeal nerve d. Bilateral external laryngeal nerve e. Vocal cords	The key is B. Unilateral recurrent laryngeal nerve.
24.	539. A 40yo man with a 25y hx of smoking presents with progressive hoarseness of voice, difficulty swallowing and episodes of hemoptysis. He mentioned that he used to be a regular cannabis user. What is the single most likely dx?  a. Nasopharyngeal cancer b. Pharyngeal carcinoma c. Sinus squamous cell carcinoma d. Squamous cell laryngeal cancer e. Hypopharyngeal tumor	The key is D. Squamous cell laryngeal cancer.  Chronic hoarseness is the most common early symptom.  Other symptoms of laryngeal cancer include pain, dysphagia, a lump in the neck, sore throat, earache or a persistent cough.  Patients may also describe breathlessness, aspiration, haemoptysis, fatigue and weakness, or weight loss.  (Patient.co.uk)

25.	543. A 67yo man with hx of weight loss complains of hoarseness of voice. CT reveals opacity in the right upper mediastinum. He denied any hx of difficulty breathing. What is the single most appropriate inv?  a. Laryngoscopy b. Bronchoscopy c. LN biopsy d. Bronchoalevolar lavage e. Barium swallow	The key is C. Lymph node biopsy. [There is weight loss and there is an opacity in right upper mediastinum. May indicate enlarged lymph node or lymphoma causing pressure on right recurrent laryngeal nerve resulting in horseness. As CT didn't reveal any bronchial lesion and no breathing difficulty it is unlikely to be a bronchial pathology. So CT guided lymph node biopsy can reveal the diagnosis].
26.	559. A 10yo girl has been referred for assessment of hearing as she is finding difficulty in hearing her teacher in the class. Her hearing tests show: BC normal, symmetrical AC threshold reduced bilaterally, weber test shows no lateralization. What is the single most likely dx?  a. Chronic perforation of tympanic membrane b. Chronic secretory OM with effusion c. Congenital sensorineural deficit d. Otosclerosis e. Presbycusis	The key is B. Chronic secretory OM with effusion.
27.	568. A 4yo has earache and fever. Has taken paracetamol several times. Now it's noticed that he increases the TV volume. His preschool hearing test shows symmetric loss of 40db. What is the most likely dx?  a. OM with effusion b. Otitis externa c. Cholesteatoma d. CSOM e. Tonsillitis	The key is A. OM with effusion. This is a wrong key. Correct key is B. Otitis externa.  [The childs preschool hearing loss and increasing the tv volume suggests that he has OM with effusion but present earache and fever points towards the diagnosis of otitis externa].
28.	586. A 4yo boy who prv had normal hearing, has a mild earache relieved by paracetamol. He has been noticed to turn up the vol on the TV. He has bilateral dull tympanic membranes. His preschool hearing test shows symmetrical loss of 40dB. What is the single most likely dx?  a. Acute otitis externa	The key is OM with effusion.
	b. Acute OM c. Ear wax d. Foreign body e. OM with effusion	RSALE

29.	588. A 75yo man has left-sided earache and discomfort when he swallows. There is ulceration at the back of his tongue and he has a palpable nontender cervical mass. What is the single most likely dx?  a. Acute mastoiditis b. Dental abscess c. Herpes zoster infection d. Oropharyngeal malignancy e. Tonsillitis	The key is D. Oropharyngeal malignancy.  [Pain ear and discomfort during swallowing, ulceration at the back of the tongue and palpable non tender cervical lymphnode is suggestive of oropharyngeal malignancy.  Acute mastoiditis and tonsillitis will not cause tongue ulcer. Similarly dental abscess will not cause tongue ulcer. In herpes zoster pain and vesicle will be in the affected nerve distribution]
30.	589. A 42yo man has been tired and sleepy for the last few weeks in the morning. His work has started getting affected as he feels sleepy in the meetings. His BMI=36. What is the single most likely dx?  a. Idiopathic hypersomnia b. Narcolepsy c. Chest hyperventilation syndrome d. OSAS e. REM-related sleep disorder	The key is D. OSAS. [Day time somnolence and obesity (high BMI of 36) points the diagnosis of OSAS].
31.	629. A teacher had a respiratory infection for which she was prescribed antibiotics. After the antibiotic course when she rejoined school, she lost her voice completely. What is the single most appropriate dx? a. Recurrent laryngeal nerve palsy b. Angioedema c. Laryngeal obstruction by medication d. Laryngitis e. Functional dysphonia/vocal cords	The key is E. Functional dysphonia/vocal cords. [Functional dysphonia is poor voice quality without any obvious anatomical, neurological or other organic difficulties affecting the larynx or voice box. It is often secondary to viral infection].
32.	656. A 56yo male pt presents with intermittent vertigo, tinnitus and hearing loss. What is the best drug tx for this pt?  a. Buccal prochlorperazine b. Oral flupenphenazine c. TCA d. Gentamicin patch on the round window e. No med tx available	The key is A. Buccal prochlorperazine. [Probable case of Menieres disease. Treated with prochlorperazine].
33.	663. Pt had a fight following which he developed bleeding, ringing and hearing loss from one ear. What is the inv of choice? a. CT b. XR skull c. Otoscopy d. MRI vestibule	The key is A. CT. This is a wrong key! Correct key is Otoscopy.

34.	667. A mother presents her 6m son who is vocalizing.	The key is A. Arrange hearing test. [Normal
	She has noticed that he doesn't respond to loud	motor milestones indicate normal
	noises. His motor milestones are normal. What is the	development but unable to respond to loud
	best management strategy?	noise at 6 months may indicate deafness].
	a. Arrange hearing test	,
	b. Assess development milestones	
	c. Reassure	
	d. Refer to speech therapist	
	e. MRI brain	RSALE
35.	675. A 10yo male child was brought by his mother	The key is C. Bluish grey tympanic
	complaining that her child watches TV at very high	membrane with air fluid levels. [In glue air
	volumes, doesn't like to play outside and instead has	there occur conductive deafness so the child
	become more sincere with reading. She	watch tv with high volume and does not
	also says that her son doesn't respond to her. What do	respond to others for this deafness].
	you expect to see on otoscopy?	
	a. Flamingo pink tympanic membrane	
	b. Attic perforation	
	c. Bluish grey tympanic membrane with air fluid levels	
	d. Inflamed tympanic membrane with cart wheel	0
	appearance of vessels	
	e. Red and inflamed tympanic membrane	
36.	679. A 5yo girl has had an URTI for 3 days and has	The key is D. OM.
	been treated with paracetamol by her mother. For	
	the last 12h she has been hot and irritable with severe	
	pain in her right ear. What is the most likely dx?	
	a. Herpes zoster infection	
	b. Impacted ear wax	I m
	c. Mumps	
	d. OM	
	e. Perforation of eardrum	
37.	681. A 27yo female was brought to the ED by her	The key is E. Applanation tonometry.
	friend from a movie theatre. She complains of	[Darkness can cause dilatation of pupil
	sudden severe pain in the eye followed by vomiting	(which occurred in the darkness of theatre
	and also was seeing colored halos. She gives a past hx	room) which (halfway dilatation) most often
	of recurrent headaches which used to resolve	precipitate acute attack of angle closure
	spontaneously. Exam: fixed, dilated ovoid pupil seen.	glaucoma and the test to diagnose this is
	What is the first inv?	applanation tonometry].
	a. CT head	
	b. MRI orbits	
	c. Blood culture and sensitivity	
	d. Toxicology screen	
	e. Applanation tonometry	
38.	690. A 28yo man complains of vertigo, nausea and	The key is C. Cyclizine. More appropriate is
	vomiting for more than 30 mins and tinnitus, hearing	A. Buccal prochlorperazine (patient.info).
	loss in the left ear. What is the tx for this pt?	[Both prochlorperazine and cyclizine can be
	a. Buccal prochlorperazine (2nd line)	used in Meniere's disease].
	b. Metachlorpromide	
	c. Cyclazine (1st line)	
	d. Cotrimazole	
	e. Ondansetron

#### Q No Questions **Explanation** A 15 year old girl is requesting for oral A. Breach confidentiality and inform authorities contraceptive pills (OCP) as she is sexually active. Under the Fraser guidelines, a competent young She refuses to tell her parents about her sexual person may be given advice on contraception. activity and mentions that her partner is a 38 However, this man is much older than her. Thus, you year old man. What is the SINGLE most would need to share information regarding this and appropriate action? breach confidentiality. A. Breach confidentiality and inform authorities If her sexual partner was of similar age, example 15 B. Advise them about safe sex and prescribe the years old, and she had the maturity to understand the advice and its implications, you should then pill C. Perform an STI screen advise them about safe sex, prescribe the COCP and D. Inform her that she can only be prescribed the do not breach confidentiality. pill after the age of 16 Breaching confidentiality in sexually active young E. Inform her that she can only be prescribed the person: pill after the age of 18 Under the Fraser guidelines, you can provide contraceptive, abortion and STI advice and treatment, without parental knowledge or consent, to young people under 16 provided that: They understand all aspects of the advice and its implications You cannot persuade the young person to tell their parents or to allow you to tell them In relation to contraception and STIs, the young person is very likely to have sex with or without such treatment Their physical or mental health is likely to suffer unless they receive such advice or treatment, and It is in the best interests of the young person to receive the advice and treatment without parental knowledge or consent However, you should share information about abusive or seriously harmful sexual activity involving any child or young person, including that which involves: A young person too immature to understand or consent Big differences in age, maturity or power between sexual partners A young person's sexual partner having a position of trust Force or the threat of force, emotional or

psychological pressure,

Bribery or payment, either to engage in sexual activity or to keep it secret

		<ul> <li>Drugs or alcohol used to influence a young person to engage in sexual activity when they otherwise would not</li> <li>A person known to the police or child protection agencies as having had abusive relationships with children or young people.</li> </ul>	
2.	A man with dementia has an ulcerative lesion on his forehead. He wants it removed so 'it can help improve his memory'. His wife says he is not fit to give consent. What is the SINGLE most appropriate action?  A. Remove the lesion after obtaining written consent from the patient  B. Document finding but do not remove lesion  C. Refer to GP for further assessment of lesion  D. Refer to psychiatrist to assess the mental capacity to give consent	D. Refer to psychiatrist to assess the mental capacity to give consent  This question is very straightforward. He is in no position to give consent and so a psychiatrist should review his mental capacity.	
	E. Review in 6 weeks		
ω.	A 15 year old girl comes in with her 15 year old boyfriend requesting for oral contraceptive pills (OCP). They are sexually active. They could not be persuaded to inform their patients about their sexual relationship or that contraceptive advice was being sought. What is the SINGLE most appropriate action?  A. Breach confidentiality and inform parents  B. Advise them about safe sex and prescribe the pill  C. Contact the police and local safeguarding officer  D. Inform her that she can only be prescribed the pill after the age of 16  E. Inform her that she can only be prescribed the pill after the age of 18	B. Advise them about safe sex and prescribe the pill This question is testing your knowledge on the Fraser Criteria. For the under-16s GMC guidance states that the duty of confidentiality is the same for children and young people as it is for adults. Confidentiality may only be breached in order to protect the adolescent or others from serious harm - for example, where issues such as child abuse and child protection are involved, or where required by law. In this situation the adolescent should be informed of the disclosure and the reasons for it. Guidance also states that 'any competent young person, regardless of age, can independently seek medical advice and give valid consent to treatment'. Note that the ability to consent changes if you are under 13. By law children under 13 are considered unable to consent.	
	NOT FO	RSALE	

- 4. A 15 year old girl attends the emergency department with mild vaginal bleeding. A pregnancy test is positive. She does not want her parents to know about her pregnancy and she refuses to disclose any information regarding her sexual partner to the healthcare professionals. What is the SINGLE most appropriate management?
  - A. Assess child's competency to make decisions
  - B. Inform her parents
  - C. Involve social services
  - D. Inform patient that she is lawfully obliged to provide her partner's name and age
  - E. Contact the police

- 5. You are the SHO in psychiatry. Your consultant is having a sexual relationship with a widowed patient that is currently being treated for depression. The lady's condition is much improved and is awaiting discharge next week. What is the SINGLE most appropriate action?

  A. Inform health minister as situation is complicated
  - B. Inform police and then give her contraception C. Report him to trust manager as per hospital
  - protocol
  - D. Inform the patient's family members
  - E. Do not take action

# A. Assess child's competency to make decisions Confidentiality under 16

A young person under 16 has the right to advice and treatment without parental knowledge and consent provided that she is competent and understands all aspects of advice and its implications, and cannot be persuaded to tell her parents or to allow you to tell them

There are only certain circumstances in which you may disclose information that a young person does not agree to disclose. These are:

- When there is an overriding public interest in the disclosure
- When you judge that the disclosure is in the best interests of the young person who does not have the maturity or understanding to make a decision about disclosure
- When disclosure is required by law
   Note that this only applies to children 13 and older.
   Sexual activity with a child under 13 is a criminal offence and should always result in a child protection referral. You should usually share information about sexual activity involving children under 13, who are considered in law to be unable to consent.

# C. Report him to trust manager as per hospital protocol

As per GMC ethical guidance, as a medical professional, one must not "pursue a sexual or improper emotional relationship with a patient or someone close to them". In this instance, you must report the incident to the appropriate seniors in your hospital as per hospital protocol to investigate the allegation. Police would only be involved if you suspect that the consultant has committed sexual assault or other criminal activity towards the patient.

NOT FOR SALE

- 6. A 32 year old woman is brought in unconscious by the ambulance after receiving the news that she has terminal breast cancer earlier in the day. She is suspected of having taken an overdose of benzodiazepines. She was found by her boyfriend with an empty bottle of tablets beside her with a note declaring that she wishes to end her life. The note specifically says that she does not want any treatment. What is the SINGLE most appropriate action?
  - A. Respect her wishes and do not treat
  - B. Wait for consciousness to obtain consent for treatment
  - C. Obtain verbal consent from her boyfriend regarding the decision to treat
  - D. Treat her with attempts to save her live despite not having a consent
  - E. Contact her parents to obtain consent to treat
- 7. You are a junior doctor working in the NHS. You suspect one of your colleagues to be under the influence of recreational drugs. What is the SINGLE most appropriate action to be taken?
  - A. Inform police
  - B. Confront your colleague directly
  - C. Inform the senior consultant
  - D. Seek for more evidence first
  - E. Report to the trust manager

# D. Treat her with attempts to save her live despite not having a consent

The question here is how binding is the note that states she is refusing treatment. To be valid and legally binding under the Mental Capacity Act 2005 (England and Wales), an advance decision refusing treatment must state exactly what treatment is being refused and in what circumstances. A suicide note in most situations is NOT a valid advance decision.

Decisions refusing life-sustaining treatment must be in writing and include a clear and specific statement that it applies even if the patient's life is at risk. It is unlikely that the note fulfils all these criteria. The document must also be signed and witnessed which in this stem is not.

#### B. Confront your colleague directly

This is the best choice out of the given choices. In PLAB 1 ethics questions, it is always safe to discuss and explore concerns.

The GMC's ethical guidance outlines state that:

- You should understand the difference between a personal grievance, that is a complaint about your own employment situation, and a concern about a risk, malpractice or wrongdoing that affects others. This is particularly important if patients or members of the public are at risk of harm
- You should be aware that poorly performing colleagues may have health problems and respond constructively where this is the case.
- You should encourage such colleagues to seek and follow professional advice and offer them appropriate help and support.
- You must not unfairly discriminate against colleagues because of an issue related to their health or a disability.
- You should, as far as possible, support colleagues who are experiencing performance problems. But, in all cases, you should remember your duty to raise concerns where you believe a colleague may not be fit

		to practise or may otherwise pose a risk of	
		serious harm to patients.

			Ī

- 10. A 13 year old girl presents to the clinic requesting morning pills. She says the condom she used with her 13 year old boyfriend split into two while having intercourse. What is the SINGLE most appropriate action?
  - A. Inform the police and then give patient contraception
  - B. Inform patient's General Practitioner
  - C. Inform patient's mother and the police immediately
  - D. Give contraception
  - E. Refer patient to another doctor to handle the case
- 11. A 45 year old man is found to be HIV positive in a Genitourinary Medicine clinic. He is not sexually active. He does not want his GP informed about his diagnosis as he has witnessed a friend who suffered discrimination following accidental disclosure of his HIV status. What is the SINGLE most appropriate action?
  - A. Accept patient's decision not to inform GP
  - B. Explain the legal and ethical duties of confidentiality to the patient and inform his GP
  - C. Explain to the patient that it is the patient's duty by law to inform his GP
  - D. Inform his GP when his viral load is below 500 copies/mL
  - E. Inform his GP only when anti-viral medications are started
- 12. A 15 year old boy in London is brought to the hospital by his parents complaining of lower abdominal pains for the past three days. A clinical suspicion of appendicitis and the decision to admit was made. The young boy refuses to be admitted as he has plans to go out with his friends tonight. He is unable to understand the serious nature of an untreated appendicitis. His parents would like to overrule his wishes and to admit him. What is the SINGLE most appropriate course of action?
  - A. Contact the local safeguarding officer
  - B. Respect his wishes and do not admit
  - C. Involve social services
  - D. Refer for a psychiatric evaluation before admission
  - E. Admit him under parental consent

#### D. Give contraception

In this case both the girl and her boyfriend are the same age. Under the GMC, there is no need to inform the police about their sexual activity as they are the same age. If the boyfriend was much older, and thereby have a greater disparity in age to the girl, then informing the police and/or social services would be considered. In this case, you are permitted to provide contraception to the girl without parental knowledge or consent as it is most likely in her best interests to do so according to the GMC.

#### A. Accept patient's decision not to inform GP

The patient's decision must be respected unless there is an overriding public interest in disclosing the information without his consent. A HIV positive patient may not need to reveal his diagnosis to the GP. He may obtain his anti-viral treatments from the GUM clinic.

One may strongly encourage the patient to consent, explaining the clear benefits of informing his GP of his status, and seek to reassure him about his GP's legal and ethical duty of confidentiality but you are not able to inform the GP unless the patient gives you permission to.

#### E. Admit him under parental consent

This young boy is under 16. He lacks maturity and is unable to understand the seriousness of his condition. You therefore can rely on parental consent.

R SALE

- 13. A mother brings her 12 year old son to you requesting surgery for his sticking out ears. She says that he is constantly teased in school because of his ears and wants him to undergo cosmetic surgery for it. The boy says he does not want surgery. What is the SINGLE most appropriate action?
  - A. Refer to private practice
  - B. Schedule surgery as his consent is not needed
  - C. Contact social services and explore their concerns
  - D. Explain to mother that surgery is not possible without her son's consent
  - E. Discuss the situation with your colleagues

# C. Contact social services and explore their concerns

The topic of consent is extremely important for the PLAB exam as well as practice in the NHS. In terms of U.K law, a person aged 16 and upward is generally considered to have capacity and is able to consent for their own medical procedures. A child is also able to consent provided they are competent in understanding the situation. This is called Gillick competence. In the above situation, the best choice is to contact social services and assess the boy's capacity to make his own decision. Surgery is a major procedure and this child should not be subject to undergo a potentially life-threatening procedure that he doesn't need just because his caregiver wishes him to.

Scheduling the surgery as his consent is not needed would be the correct answer IF this was an emergency procedure that the child needed in order to survive. In those conditions, parental consent would overrule the child's wishes as the procedure would be in the best interests of the child.

Not performing the surgery since the boy has not given consent cannot be chosen blindly without exploring whether the child has capacity or not. A safe answer for PLAB exam ethics questions is always discussing and exploring patient concerns.

- 14. A 31 year old Jehovah's Witness was in a car accident and brought into the emergency department. He has lost a massive amount of blood. He is given IV fluids. He is in critical condition and blood products are needed but he refuses any form of blood products due to his religious beliefs. What is the SINGLE most appropriate next step?
  - A. Transfuse blood against his will
  - B. Respect his decision and do not transfuse blood
  - C. Contact the police
  - D. Involve social services
  - E. Seek legal advice

B. Respect his decision and do not transfuse blood Jehovah's Witnesses and Blood transfusion You must respect a competent patient's decision to refuse an investigation or treatment, even if you think their decision is wrong or irrational. You may advise the patient of your clinical opinion, but you must not put pressure on them to accept your advice. You must be careful that your words and actions do not imply judgement of the patient or their beliefs and values.

Many Jehovah's Witnesses have strong objections to the use of blood and blood products, and may refuse them even if they may die as a result. Hospital liaison committees established by the Watch Tower Society (the governing body of Jehovah's Witnesses) can advise on current Society policy. They also keep details of hospitals and doctors who are experienced in 'bloodless' medical procedures.

- 15. A 30 year old man is found to be HIV positive and is against condom use. After discussing with him, he is still refusing to accept the need to tell his wife of his diagnosis. What is the SINGLE most appropriate action
  - A. Inform the police
  - B. Do not inform the police
  - C. Inform health authorities
  - D. Consult with social services
  - E. Notify wife via partner notification programme

- 16. A 30 year old female is brought into the Emergency Department by her husband drifting in and out of consciousness following a road traffic accident. She is in shock and requires immediate blood transfusion. Her husband objects saying they are devout Jehovah's Witnesses and are against blood transfusion. Her condition is deteriorating. What is the SINGLE most appropriate action?
  - A. Do not transfuse blood because there is no consent
  - B. Transfuse blood without consent
  - C. Inform health authorities as situation is complicated
  - D. Seek judicial review instructions
  - E. Consult social services
- 17. A 48 year old man recently had a transient ischaemic attack. What advice on driving would you give him?
  - A. Continue to drive only when accompanied by another person
  - B. Continue to drive without any restrictions
  - C. Drive on the familiar roads and avoid busy roads
  - D. Stop driving completely
  - E. Do not drive for at least one month

E. Notify wife via partner notification programme In the UK, there are partner notification services for those diagnosed with sexually transmitted infections (STI) and/or HIV. This service's main aim is to inform unsuspecting partners of those infected of the possibility of being infected with STI/HIV and to seek medical care. Under normal circumstances, the patient affected is offered a choice: to inform their partner(s) themselves or to provide details of those partner(s) to the healthcare worker to contact them anonymously. Usually, it is a mix of the above where the patient is given a time frame to inform their partner(s) and if not done by that set date, the healthcare worker will be the one to inform. In this case, the man refuses to tell his wife the diagnosis. As this is a communicable disease, the wife needs to be informed as she will need to be tested. Therefore, you would contact her via protocols of the partner notification programme.

#### B. Transfuse blood without consent

In this emergency situation, there are a few reasons why a doctor should be transfusing blood without consent. Firstly, the patient is not conscious enough to make an informed decision pertaining to blood transfusion. Her husband in this case is not permitted to make that decision for her as there is no indication in the case stem that there is an advance directive allowing her husband to do so. Under normal circumstances, most Jehovah's Witnesses would carry a blood refusal card which states that they would refuse blood products under emergency situations. In this case, there is no mention of a blood refusal card. Therefore, you would treat this patient just like any other unconscious patient that has entered the Emergency Department until she is able to have capacity to make an informed decision.

#### E. Do not drive for at least one month

You must stop driving for at least 1 month after a transient ischaemic attack (TIA). You can be fined up to £1,000 if you do not tell DVLA about a medical condition that affects your driving.

18.	You are a junior doctor eating with a few friends in a restaurant. On leaving the restaurant, you notice an empty table with patient's medical notes. The table has been unattended for a while. What is the SINGLE most appropriate action? Plab Lab Values  A. Request that the restaurant manager call the hospital  B. Look through the medical notes and attempt to phone the patient  C. Look through the medical notes for a general practitioner contact and inform the practice  D. Take the medical notes to the hospital  E. Ignore the incident and walk out of the restaurant	C. Look through the medical notes for a general practitioner contact and inform the practice Informing the GP practice would be the most practical option. The GP surgery would have all the records of the patient and they would be able to advise you what you need to do with the notes. It may be possible that the GP surgery would ask you to bring the notes into the practice and they will keep it securely or scan a copy to the hospital if needed.  The second most appropriate option is to bring the notes to the hospital. This is inconvenient as great efforts and time would be needed to find the department that this patient attended.
19.	234. A woman brought her husband saying she wants the 'thing' on his forehead removed. The husband is refusing tx saying it improves his thinking. What is the most appropriate next step?  a. Assess his mental capacity to refuse tx b. Remove lesion c. Refer to ED d. Mini-mental state exam e. Refuse surgery and send pt back	The key is A. Assess his mental capacity to refuse treatment.
20.	526. A 34yo man with MS has taken an OD of 100 tablets of paracetamol with intent to end his life. He has been brought to the ED for tx but is refusing all intervention.  a. Assessment b. Evaluate pt's capacity to refuse tx c. Establish if pt has a prv mental illness The key is B. Evaluate patients capacity to refuse treatment.	
21.	974. An elderly man who used to work in the shipyard industry presented with cough and SOB few weeks to months. He was given salbutamol nebulization and antibiotics and admitted to the ward. He died 3d later. CT: patchy infiltrates, pleural thickening and pleural effusion. Why is this a coroner's case?  a. Pt got wrong dx or management b. Pt died soon after admission c. Death could be due to occupational illness	The key is C. Death could be due to occupational illness.

- 22. 1037. A man with dementia has an ulcerative lesion on his forehead. He wants it removed so 'it can help improve his memory'. Wife says he is not fit to give consent. What will you do?
  - a. Get letter signed from the GP
  - b. Get letter signed from the wife
  - c. Get letter signed from the pt
  - d. Refer to psychiatrist to assess the mental capacity to give consent
- 23. 1595. A 78yo pt is diagnosed with metastatic lung cancer; there is no cure for his condition. His son tells the physician that in the case of a diagnosis of cancer, the physician must not tell his father. He wishes that his father does not suffer any psychological distress caused by the knowledge of a terminal diagnosis. Which one of the following ethical principles supports the son's request?
  - a. Patient autonomy
  - b. Beneficence
  - c. Justice
  - d. Non-maleficence

The key is D. Refer to psychiatrist to assess the mental capacity to give consent

# R SALE

The key is D. Non-maleficence. [Nonmaleficence means non-harming or inflicting the least harm possible to reach a beneficial outcome. Harm and its effects are considerations and part of the ethical decision-making process in the NICU. Short-term and long-term harm, though unintentional, often accompany life-saving treatment in the NICU.

- 15. 1651. A 59yo man has shown a change in his mood and personality over a 9m period. He has subsequently developed difficulty with memory and conc, and then progressive fidgety movements of his limbs and facial musculature. By the time of medical assessment he has frank choreiform movements and a mini-mental state exam of 21/30. Other exam is normal. He was adopted and therefore no information on his famhx is available. He has 3 adult children (27, 30,33) of whom the 2 youngest are asymptomatic. However, the oldest son has recently been inv by the neurology dept for slightly erratic behavior and fidgety restless movements of both legs. Based on the likely clinical dx, which one of the following genetic patterns is most likely?
  - a. AD inheritance with anticipation
  - b. AD with variable penetrance
  - c. AR
  - d. X-linked
  - e. Mitochondrial disorder

- 16. 1695. A middle aged woman has severe collapse of the right femoral head requiring replacement. The removed femoral head is sent for pathology and is found to contain enlarged fat cells. The pathologist explains that this is the likely cause of the patient's femoral head collapse. A likely aetiology is
  - a. Septic emboli
  - b. Impaired venous drainage
  - c. Hgb SS disease
  - d. Steroid use
  - e. Alcoholism
  - f. Gaucher's disease
  - g. missed fracture
  - h. Cushing's disease
  - i. Radiation
  - i. Vasculitis

Key is A: AD inheritance with anticipation

• Patient is suffering from Huntingtons disease and that is autosomal dominant with anticipation which means a genetic disorder is passed on to the next generation, the symptoms of the genetic disorder become apparent at an earlier age with each generation.

#### **Huntingtons Disease:**

- It is an inherited (genetic) condition that affects the brain and nervous system. It can interfere with movements of your body, can affect your reasoning, awareness, thinking and judgement (cognition) and can lead to a change in your behavior
- This faulty gene is carried on chromosome 4.
- HD affects between 5-10 people per 100,000 in the UK.

#### Presentation

The symptoms of HD can be grouped into three main areas:

- Problems with movement
- Problems with cognition
- Mood and behavioural problems
   Treatment:
- At present there is no cure for HD. Also, there is no treatment that has been found to delay the onset of symptoms or to delay the progression of symptoms

The key is F. Gaucher's disease fits here in the scenario although common causes are Steroid use and trauma.

	QUESTION NUMBER	ANS	KHALID'S EXPLANATION LATEST FROM 14.06.2017
1.	7) A 60yo man presents with dysphagia and pain on swallowing both solids and liquids. A barium meal shows gross dilatation of the esophagus with a smooth narrowing at the lower end of the esophagus. What is the SINGLE most likely cause of dysphagia?  a. Achalasia b. Myasthenia gravis c. Esophageal carcinoma d. Esophageal web	R	The key is A. Achalasia. [Dysphagia for both solid and liquid or prominently liquid suggest achalasia where dysphagia to solid suggest stricture. Also gross dilatation of oesophagus with smooth narrowing at lower end is seen in achalasia. In achalasia dysphagia is usually described as progressive].
	e. Systemic sclerosis		
2.	13. A 29yo lady who is a bank manager is referred by the GP to the medical OPC due to a long hx of tiredness and pain in the joints. An autoimmune screen result showed smooth muscle antibodies positive. What is the most appropriate next inv?  a. ECG b. TFT c. LFT d. Serum glucose e. Jejunal biopsy		The key is C. LFT. [A case of autoimmune hepatitis. Autoimmune hepatitis is an uncommon cause of chronic hepatitis which if untreated can lead to cirrhosis. However, with treatment outlook is very good. Smooth muscle antibody is positive in autoimmune hepatitis. Definitive investigation is liver biopsy. Treated with steroid [start with high dose prednisolone]. Azathioprine is commonly added with steroid to reduce its dose as steroid has more side effects than azathioprine].
3.	20. A 64yo pt has been having freq episodes of		Key not given. Correct key is both C and D! [Villous
	secretory diarrhea, which is extremely watery, with large amounts of mucus. A dx of villous adenoma was made after endoscopy. What electrolyte abnormality is most likely in this pt?  a. Hyperkalemia b. Hypernatremia c. Hyponatremia d. Hypokalemia		adenoma can cause both hyponatremia and hypokalemia].
4.	40. A young male whose sclera was noted to be yellow by his colleagues has a hx of taking OTC drugs for some pain. Tests showed raised bilirubin, ALT and AST normal. The provocation test with IV nicotinic acid is positive and produces further rise in the serum bilirubin levels. What is the most likely dx?  a. Acute hepatitis b. Drug hypersensitivity c. Gilberts syndrome d. Acute pancreatitis		The key is C. Gilbert's syndrome. [Only bilirubin is increased but not the liver enzymes. Also positive nicotinic acid provocation test is in its favour].
	NOTFC	R	SALE

5.	41.A 24yo biker has been rescued after being trapped under rocks for almost 12h. He complains of reddish brown urine. His creatinine is 350umol/L and his urea is 15mmol/L. What is the most imp step in the management of this patient?  a. Dialysis b. IV NS c. IV dextrose d. IV KCI e. Pain relief	R	Key is B. IV NS. [It is a case of rhabdomyolysis which is initially treated with IV NS].
6.	61. A pt with hepatocellular ca has raised levels of ferritin. What is the most probable cause? a. Hemochromatosis b. A1 antitrypsin def c. Cystic fibrosis		The key is A. Haemochromatosis. [Hemochromatosis itself is a cause of hepatocellular carcinoma and associated with raised level of ferritin. Serum ferritin levels elevated higher than 200 mcg/L in premenopausal women and 300 mcg/L in men and postmenopausal women indicate primary iron overload due to hemochromatosis, especially when associated with high transferrin saturation and evidence of liver disease. Ferritin concentration higher than 1000 mcg/L suggests liver damage with fibrosis or cirrhosis].
7.	63. A 32yo man presented with slow progressive dysphagia. There is past hx of retro-sternal discomfort and he has been treated with prokinetics and H2 blockers. What is the probably dx?  a. Foreign body b. Plummer vinson syndrome c. Pharyngeal puch d. Peptic stricture		1. The key is D. Peptic stricture. [Progressive dysphagia to mostly solid is suggestive of peptic stricture which is supported here by the use of prokinetic drugs and H2 blockers which are used for reflux oesophagitis].
8.	e. Esophageal Ca  77. A 55yo man has had severe pain in the right hypochondrium for 24h. The pain comes in waves and is accompanied by nausea. Nothing seems to relieve the pain. He feels hot and sweaty but has normal temp. What is the most appropriate next inv?  a. US Abdomen b. ERCP c. MRCP d. Serum amylase e. UGI endoscopy	R	1. The key is A. US abdomen. The diagnosis is biliary colic. Points in favour- i) severe right hypochondrial pain. ii) colicky nature of the pain (comes in waves) iii) nausea iv) absence of fever iv) absence of jaundice. [OHCM, 9 <sup>th</sup> edition, page-637].

9.	79. A woman who returned from abroad after 3		1. The key is C. Malabsorption.
	weeks of holiday complains of severe diarrhea of 3		Diarrhoea, IDA and folic acid deficiency.
	weeks. She also developed IDA and folic acid def.		Iron-deficiency anaemia.
	What condition best describes her situation?		<ul> <li>Folate deficiency or vitamin B12 deficiency.</li> </ul>
	a. Jejunal villous atrophy		Bleeding, resulting from low vitamin K.
	b. Chronic diarrhea secretions		Oedema, which occurs in protein/calorie
	c. Malabsorption		malnutrition.
	d. Increased catabolism		
	e. Increased secretions of acid		
10.	93. A 48yo woman is admitted to ED with a		1. The key is D. Achalasia.
	productive cough and moderate fever. She has		2. Points in favour: Aspiration pneumonia due to
	often central chest pain and regurgitation of		retained food and fluid in oesophagus. In achalasia
	undigested food most times but doesn't suffer		usually there is no acid reflux. Dysphagia for both
	from acid reflux. These symptoms have been		food and drink. Air-fluid level behind heart.
	present for the last 3.5 months which affects		Why it is not hiatus hernia? Differentiating point:-
	both food and drink. A CXR shows an air-fluid	9	i) In hiatus hernia usually you will get associated
	level behind a normal sized heart. What is the		GORD ii) Also in hiatus hernia there may be nausea
	most likely dx?		or vomiting.
	a. Pharyngeal pouch		Why it is not pharyngeal pouch? In pharyngeal
	b. Hiatus hernia		pouch there will be halitosis.
	c. Bulbar palsy		X)
	d. Achalasia		
	e. TB		
11.	110. A 35yo man presents with hx of dyspepsia.		1. Gastroscopy.
	H.Pylori antibodies are negative. No improvement is	\	2. Not responding to treatment D/D is: i) Jollinger
	seen after 1m of tx. What is the next step?	)	Elison syndrome ii) Ca stomach
	a. Urea breath test		3. Indications of gastroscopy in a 35 yo man (for man of
	b. Gastroscopy		age <50): i) Acute symptoms with H/O previous episode
	c. CT	\	(PUD) ii) Alarm features [weight loss, anaemia,
	d. MRI		vomiting, hematemesis and melaena, dysphagia,
			palpable abdominal mass], fear of cancer, evidence of
		/	organic disease.
12.	125. A 35yo male builder presented with sudden		The key is E. Perforated peptic ulcer. [NSAIDs induced /
	onset of severe abdominal pain. He was previously fit	\	perforation. Points in favour- 1. Prolonged use of
	and well other than taking ibuprofen for a long term	\	NSAIDs, 2. Sudden onset of severe abdominal pain, 3.
	knee injury. On examination he is in severe pain,	\	Rigid abdomen].
	pulse=110bpm, BP=110/70mmHg and has a rigid		
	abdomen. What is the most likely dx?		
	a. Biliary peritonitis		
	b. Ischemic colon		
	c. Pancreatic necrosis		
	d. Perforated diverticulum		
	e. Perforated peptic ulcer

13.	144. A 45yo woman has had severe epigastric and right hypochondrial pain for a few hours. She has a normal CBC, serum ALP is raised, normal transaminase. 3 months ago she had a cholecystectomy done. What is the most appropriate inv?  a. US abdomen b. ERCP c. MRCP d. CT abdomen e. Upper GI endoscopy	R	1. The key is B. ERCP. It is probably a wrong key and correct key should be C. MRCP. [Post operative US of abdomen does not give good result for hepatobiliary system. ERCP is invasive procedure and it has its considerable complications like cholangitis, injury, pancreatitis etc. Among given options MRCP is most appropriate. We shall go for ERCP after making the dx confirm. For this MRCP is preferred. If the question asks which is the "DEFINITIVE" or the "MOST DIAGNOSTIC" then the option will be ERCP].  2. Diagnosis is choledocolithiasis.
14.	209. A 79 yo lady who is otherwise well recently started abdominal pain. She is afebrile and complains that she passed air bubbles during urination. A urethral catheter showed fecal leakage in the urinary bag. What is the likely pathology? a. Diuretics b. CD c. Rectosigmoid tumor d. Large bowel perforation e. UC		The key is B. CD. [debate came that Crohn's disease cannot occur in 79 yrs but this is not the case! "Crohn's disease can occur at any age, but is most frequently diagnosed in people ages 15 - 35. About 10% of patients are children under age 18". [http://www.nytimes.com/health/guides/disease/crohn s-disease/risk-factors.html]. So I think it can occur in this age also and the feature like fistula is a common association of CD].
15.	216. A young woman complains of diarrhea, abdominal cramps and mouth ulcers. AXR shows distended transverse colon with goblet cell depletion on rectal biopsy. What is the most probable dx? a. CD b. UC c. Bowel Ca d. Bowel obstruction e. IBS		1. The key is B. UC. 2. In UC there is goblet cell depletion and less mucous production in contrast with CD where there may be goblet cell hyperplasia and mucous secretion is not reduced. Please note aphthous ulcer can develop in both CD and UC.
16.	223. A 28 yo female presents with a 3m hx of diarrhea. She complains of abdominal discomfort and passing stool 20x/day. Exam=febrile. Barium enema shows cobblestone mucosa. What is the most likely a. Ameoba b. Colon Ca c. GE d. CD e. UC		The key is D. CD. [Hx of diarrhea, abdominal discomfort, and patient being febrile indicate gut inflammation and cobblestone appearance on barium enema is suggestive of CD].

20.	531. A 5yo child was admitted with hx of feeling tired and lethargic all the time, bleeding gums and sore throat since the last 3months. Exam: hepatosplenomegaly. What is the most probable dx?  a. ALL b. AML c. CML d. CLL	The key is A. ALL. [Commonest leukemia in children is ALL. Bleeding gums (low platelet), feeling tired and lethargic, sorethroat, hepatosplenomegally all are well known features of ALL].
21.	e. Lymphoma  532. A 65yo man presents with back pain. Exam: splenomegaly and anemia. Blood: WBC=22, Hgb=10.9, Plt=100, ESR=25. He has been found to have Philadelphia chromosome. What is the single most likely dx?  a. ALL b. AML c. CML d. CLL e. Lymphoma	The key is C. CML. [anaemia, raised WBC count, low platelet (platelet may be variable) are known features of CML, splenomegaly (particularly if massive) is very suggestive of CML and Philadelphia chromosome is characteristic of CML].
22.	584. A 15yo girl was admitted with anemia, chest infection and thrombocytopenia. She was treated and her symptoms had regressed. She was brought again with fever and the same symptoms a few days later. She also seems to have features of meningitis. What is the most likely dx?  a. AML b. ALL c. Aplastic anemia d. CML e. CLL	The key is B. ALL. [The age supports the diagnosis of ALL along with the given picture. Same picture can happen in aplastic anaemia but there is not a single factor mentioned in favour of it. So ALL can be taken as best option in the given scenario].
23.	677. A 45yo woman undergoing tx for RA for the last 5yrs presents with dizziness, easy fatigabiliy and lack of energy. A blood film shows MCV 106. What could be the most probable reason for her anemia?  a. Steroids b. Chronic disease c. NSAIDs d. Methotrexate e. Sulfasalazine	The key is D. Methotrexate. [Methotrexate leads to folate deficiency anaemia].
	NOTFOR	SALE

24.	687. A 5yo boy has cough and swelling at the knee after falling on the ground with rashes on the buttocks which are non-blanching. PT=13, APTT=71, Hgb=11, WBC=8, Plt=200. Choose the most likely dx? a. NAI b. Hemophilia c. HSP d. Osler weber reindu syndrome e. Von-Willebrand disease	R	The key is B. Hemophilia. This is a controversial key! Correct key should be E. Von-Willebrand disease. [Likely D/D may be B or C! in von willebrands disease usually there is no hemarthrosis (except in type 3) and in hemophilia no nonblanching rash (there may bruising). isolated rise in APTT is highly suggestive of hemophilia (given case). This is an ill defined question and only likely diagnosis may be type 3 von willebrands disease].
25.	696. A 4yo boy has a cough and arthritis followed by rash on legs which are non-blanching on glass test. No hx of fever. PT=13, APTT=31, Hgb=12, WBC=6.5, Plt=300. What's the most likely dx? a. Meningitis septicemia b. Hemophilia c. HSP d. ITP e. TTP		The key is C. HSP. [Usually occurs below 10 yrs of age. The characteristic rash and lab findings matches with HSP].
26.	710. A 6yo boy has completed an induction course of chemo for ALL. He has an enlarged left scrotum. What is the most appropriate next step? a. Herniotomy b. CT abdomen c. Biopsy d. Immediate surgery e. Reassurance		The key is B. CT abdomen. This is wrong key. Correct key is C. Biopsy. [Relapse may directly involve testis and excisional biopsy is done to confirm recurrence of leukemia].
27.	726. A 40yo lady who has been a smoker since she was a teenager has the following blood result: Hgb=19. What hormone should you check? a. Aldosterone b. Cortisol c. Erythropoietin d. T4 e. TSH		The key is C. Erythropoetin. [Smoking causes raised carboxyhemoglobin level causing hypoxemia and raised erythropoeitin which leads to raised hemoglobin level (secondary polycythemia)].
28.	730. A 55yo man presents with HTN. He complains of headache and visual disturbances. He also reports itching after a hot bath and burning sensation in finger and toes. His face is flushed red. PE: mild splenomegaly. Inv: Hgb=20g/dl, WBC=20, plt=500, EPO normal. What is the likely dx? a. Myelofibrosis b. Polycythemia rubra vera c. Essential thrombocythemia d. CML e. CLL	R	The key is B. Polycythemia rubra vera. [Raised hemglobin, raised cell counts and normal erythropoeitine along with symptoms of hyperviscosity like headache and associated hypertension are diagnostic of polycythemia rubra vera].

29.	755. A 12yo boy complains of acute development		The key is A. ITP. [Isolated thrombocytopenia and
	of purpura on the dependent areas of his body		H/O prior URTI with development of purpura on the
	2wks after a URTI. The purpura doesn't blanch on		dependent areas of the body favours the diagnosis of
	pressure, tests reveal: Hgb=12, plts=50,		ITP. (In ITP BT is prolonged which is present here.)].

commenced on Ticarcillin, Tazobactam and next step is to add antifungal agents].	
Gentamicin. He has also recently commenced on	
Meropenem but on the 3rd day his temp still	
remains >39C. 2 blood tests and urine cultures show	
no organism. Inv: Hgb=104g/dl, WBC=<0.5, Plt=15.	
What will you do next?	
a. Continue IV antibiotics and add oral antifungals	
b. Continue antibiotics and add IV antifungals	
c. Stop antibiotics	
d. Continue only present antibiotics	
39. 830. A 32yo man has been to Thailand and returned The key is B. EBV. [Cervical lymphadenopathy	
with cervical lymphadenopathy and fever. What is mentioned in question which occurs in EBV	
he most likely suffering from? infection. In ARS (acute retroviral syndrome) or	
a. HIV primary HIV infection there is generalized	
b. EBV lymphadenopathy].	
c. Typhoid	
d. Measles	
40. 833. A 44yo man went on holiday to Sudan 5wks The key is D. Schistosomiasis. [Holyday in Sudan,	
ago. He now presents with red urine and fever. hematuria, fever and hepatomegaly goes most with	
Exam: hepatomegaly. What is the most likely dx? Schistosomiasis amongst the given option].	
a. Malaria	
b. Brucellosis	
c. Leptospirosis	
d. Schistosomiasis	
41. 834. A 32yo homosexual comes with hx of weight The key is B. CMV. [Weight loss in a homosexual is	
loss. Fundoscopy reveals retinal hemorrhages.   likely to be due to AIDS and CMV retinopathy with	
What is the single most appropriate option? retinal hemorrhage is a recognized association].	
a. Mycobacterium avium	
b. CMV	
c. Hemophilus influenze	
d. NHL	
e. Pneumocystic jerovici	
42. 837. A 17yo has acute pain around his right eye, pain The key is E. Herpes zoster. [It seems to be herpes	
a. Ear wax	
b. Ear foreign body	
c. Dental abscess d. Cellulitis	
d. Cellulitis	
e. Herpes zoster	
43. 852. A 3yo girl presents with fever for 2d. She is  The key is E. CSF analysis. [It is really very difficult to	
drowsy and had a seizure causing twitching of the differentiate between encephalitis and meningitis.	

	right side of the body for 4mins. Her RR=30bpm,	Encephalitis is mostly viral and in UK herpes simplex
	sat=90%, temp=38.9C, capillary refill time=2s.	virus is the main cause. Meningitis also has a viral
	Urine negative on dipstick. What is the single inv	predominance though less than encephalitis.
	most likely to lead to dx?	Because encephalitis involves infection of the brain
	a. Blood for C&S	itself, symptoms of altered brain functionlike
	b. ESR	confusion or decreased alertnessare usually
	c. CXR	present, while in cases of meningitis the patient is
	d. Urine for C&S	initially alert and, though understandably distracted
	e. CSF analysis	by pain and misery, still in command of their mental
	e. CSF dildlysis	
		processes.
		As CSF can not differentia between meningitis and
		encephalitis we have to take help of imaging like
		MRI. In herpes simplex encephalitis there is
		characteristic hyperintensity in fronto-temporal
		region.
		In the given case there are features of raised
		intracranial pressure like drowsiness and seizer and
		so we cannot proceed for LP unless guided by CT (or
		MRI). On the other hand there is no other option
		that can be diagnostic of the given condition. So we
		have to happy with CSF analysis as the key though at
		this moment we have to withheld this procedure].
44.	854. A 3yo boy presents with a 1d hx of being	The key is A. Blood for C&S. [Likely diagnosis is
	unwell. He appears shocked and has 3h old rash	septicemia for which Blood culture is the
	made	investigation of choice].
	up of urticarial and purpural spots. His RR=30bpm,	
	sat=94%, temp=39C, capillary refill time=1s.	
	Urine is clean on dipstick. What is the single inv most	
	likely to lead to dx?	
	a. Blood for C&S	
	b. ESR	
	c. CXR	
	d. Urine for C&S	
	e. CSF analysis	
45.	896. What is the mode of spread of chicken pox?	The key is A. Airborne.
	a. Airborne	
	b. Close contact	
	c. Fecal-oral	
	d. Blood	
	e. Vector	
46.	912. A 16wk pregnant pt who was exposed to a	The key is B. Ig. [If you are pregnant, come contact
40.	child with chicken pox came to GP for help. She was	with chicken pox case, found antibody negative on
	tested –ve for varicella antibody. What is the next	blood test you have to take injection Ig. Ref:
	·	
	most imp step in management?	patient.info].
	a. Reassurance b. Ig	DCVIE
	b. Ig	NOALE
	c. Ig + vaccine	
	d. Vaccine only	
	e. Acyclovir	

47.	914. A 5yo boy was brought to GP with high temp and many vesicles on his back. What is the most appropriate management? a. Topic acyclovir b. Oral acyclovir c. Oral antibiotics d. Topical steroids e. None	The key is E. None. [A case of chickenpox. None of the given treatment is used in chickenpox. Symptomatic treatment like, acetaminophen if fever, antihistamine and calamine lotion is given].  RSALE
48.	927. A 5yo child came from Ghana 6wks ago. 2d ago he developed fever, vomiting and neck stiffness. He had taken malaria prophylaxis and had no rash. What is the dx? a. Cerebral abscess b. Cerebral malaria c. Meningococcal meningitis d. SAH e. Cerebral tumor f. Pneumonia	The key is B. Cerebral malaria. [Incubation period of malaria is 7 – 30 days. Malaria prophylaxis cannot give confirmed protection and there is often failure of prophylaxis. Fever, vomiting, neck stiffness are consistent with cerebral malaria].
49.	1002. A 25yo woman has a recent cough, hoarseness and swelling in the neck. There are several nontender swellings on both sides of her neck. She has lost 13kgs. She takes recreational drugs. What is the most probable dx?  a. Thyrotoxicosis b. Hyperthyroidism c. Vocal cord nodules d. Carcinoma bronchus e. TB	The key is E. TB. [Cough, wt. loss, non-tender cervical lymphadenopathy, and immunodeficient state as a result of recreational drug use all these favours the diagnosis of TB. Laryngeal involvement may be the cause of horseness].
50.	1007. A 34yo male presents with headache and vomiting. Exam: temp=38.5C, neck stiffness, discharge from left ear and right sided hyper-reflexia with an extensor plantar response. What is the most likely dx?  a. Cerebral tumor  b. Meningitis  c. Cerebellar tumor  d. Cerebral abscess  e. Normal pressure hydrocephalus	The key is D. Cerebral abscess. [Otitis media can lead to cerebral abscess].
51.	1012. A 33yo man presented to the GP with hx of headaches and photophobia. The GP examines him and finds a rash and is now ringing you at the hospital for advice. What would you advice the GP? a. Send pt home	The key is B. Start IV benzylpenicillin. [Before hospitalization IV benzylpenicillin. In hospital Ceftriaxone can be given but not in calcium containing fluid instead give Cefotaxime (NICE).  According to OHCM hospital management is

	b. Start IV benzylpenicillin c. Conduct LP	Cefotaxime if <55yrs and Cefotaxime + Ampicillin if >55yrs ].
	d. Start IV ceftriaxone	
	NOT FO	RSALE
52.	1026. A 45yo man has developed an annular rash with a scaly edge on his thigh. The rash has been spreading over the last 3wks. He has some general aches and pains. What is the single most useful investigation?  a. ANA b. Biopsy lesion c. Lyme antibodies d. Skin scrap for mycology	The key is C. Lyme antibodies. [Spreading annular rash suggests erythema migrans of lyme disease].
53.	e. Skin swab for bacteria  1076. A 7yo school boy has been dx with meningococcal meningitis. What is the advice for schoolmates and staff?  a. Rifampicin for the whole class and family b. Rifampicin for the whole school and family c. Meningococcal vaccine for the family d. Benzylpenicillin e. IV cefotaxime	The key is A. Rifampicin for the whole class and family. [In contacts of meningococcal meningitis chemoprophylaxis is given with Rifampicin].
54.	1081. A 30yo man from Australia returned from a business trip to Indonesia 6d ago presenting with complaints of fever, joint and muscle ache and headache, in particular behind the eye for the past 2 days. What is the most probable dx?  a. Malaria b. Chicken pox c. TB d. Lyme's disease e. Dengue	The key is E. Dengue. [Fever, arthralgia, myalgia, headache these are common in dengue fever. Particularly retro-orbital pain is well recognized feature of dengue fever].
55.	1084. A 24yo male who is sexually active with other males with hx of discharge per urethra. Dx of chlamydia has been made. What is the possible complication if left untreated?  a. Orchitis b. Balanitis c. Epididymo-orchitis d. Acute abdomen	The key is C. Epididymo-orchitis.
	NOTFO	RSALE

56.	1151. A child was admitted with fever, generalized	The key is B. Impetigo. This is probably a wrong key!
	skin lesion, some of them are weeping lesions and	Likely correct key should be A. Varicella. [Please
	some of them are crusted. What is the most	consider dx of impetigo if specifically mention honey
	probable dx?	(or yellow or golden) coloured lesion or distribution
	a. Varicella	described to be on face and limbs predominately.
	b. Impetigo	Otherwise consider chickenpox. Though key is
	c. Drug reaction	impetigo here, it is wrong key. Likely correct option
	d. Contact dermatitis	here is varicella].
	e. Scabies	licite is varietiaj.
57.	1155. A child had a patchy rash following tx for sore	The key is A. Ampicillin. [Infectious mononeucleosis
37.		can present with sorethroat and lymphadenothy like
	throat & cervical LN enlargement. Which is the most	, · · · · · · · · · · · · · · · · · · ·
	appropriate antibiotic?	tonsillitis and if treated with ampicillin leads to
	a. Ampicillin	eruption of patchy rashes].
	b. Erythromycin	
	c. Cefuroxime	
	d. Metronidazole	
	e. Tetracycline	
58.	1166. A healthy 8yo boy had antibiotic tx for	The key is A. He will recover fully to his prv health.
	meningitis. Initially he wasn't resuscitated. What will	
	be the outcome if he receives full tx?	
	a. He will recover fully to his prv health	
	b. He will have hearing impairment	
	c. He will have brain abscess	
	d. He will have encephalitis	
59.	1183. A 38yo man presents with acute infection of	The key is A. Penicillin + Flucloxacillin. [Cellulitis is
	skin in the leg. Dx of cellutitis has been made. What	usually caused by bacteria, such as staphylococci or
	meds should be prescribed?	streptococci that are commonly present on the skin.
	a. Penicillin + Flucloxacillin	So Penicillin + Flucloxacillin should be given].
	b. Metronidazole + erythromycin	00 1 011011111 1 1 1 1 1 1 1 1 1 1 1 1
	c. Vancomycin + metronidazole

60.	1186. A homeless lady presents with cough and	The key is A. AFB. [Cough, fever, night sweat and
60.	fever. She complains of night sweats and weight	weight loss are very suggestive of TB. So we should
	loss. CXR has been done and shows opacity. What is	do AFB as her next investigation].
	the next appropriate management?	
	a. AFB	
	b. Mantoux test	
	c. IFN gamma testing	
	d. Bronchoscopy	
	e. CT	
61.	1202. A lady from Asia presented with lump in her	The key is B. TB lymphadenitis. [Central caseous
	neck. FNAC has been done and revealed lesions with	necrosis with sourrounded fibrosis is diagnostic of TB
	caseous material in the center surrounded by	lymphadenitis. The most common cellular
	fibrosis. What is the most probable dx?	components seen are epithelioid cell clusters.
	a. Thyroid carcinoma	Lymphocytes and langhans giant cells are also seen].
	b. TB lymphadenitis	
	c. Lymphoma	
	d. Inf Mono	
i		

62.	e. Mesothelioma  1204. A young boy presented with peri-oral blisters.  Some of which are weeping and others are crusted. What is the single most appropriate dx?  a. Impetigo b. Varicella zoster c. Shingles d. Scabies e. Herpes simplex	The key is A. Impetigo. [Distribution of varicella zoster is centripetal (more in central area (trunk) and less in limbs and face. On the other hand if blisters are present mainly on face or limbs and/or described as golden, yellow or honey coloured crusts are impetigo].
63.	1205. A 39yo man comes with umbilicated papules on his face. His CD4 count is measured to be 35. What is the single most appropriate option?  a. Mycobacterium avium intercellular b. CMV c. Streptokinase d. Toxoplasmosis e. Pneumocystis jerovici f. Moluscum contagiosum	The key is F. Molluscum contagiosum. [CD4 count 35 is too low indicating immunodeficiency where molluscum contagiosum occurs more easily. Umbilicated papules are feature of molluscum contagiosum].
64.	1216. A 34yo man from Asia presented with 5m hx of productive cough, night sweats and weight loss. His CXR reveals some shadowing in the left upper zone. What is the single most discriminating inv?  a. AFB for sputum b. CXR c. CT d. TFT e. US abdomen	The key is A. Sputum for AFB. [Features are suggestive of PTB for which most discriminating inv. Is Sputum for AFB].
65.	1217. A prv healthy 23yo presented a week hx of bloody diarrhea and abdominal pain with cramps and fever. Exam: tenderness in lower abdomen.  What is the most appropriate dx? a. Celiac disease b. Colorectal polyps c. UC d. Laxative abuse e. Gastroenteritis	The key is E. Gastroenteritis. [A short history (one week) of bloody diarrhea, abdominal pain with cramps, fever and tenderness in lower abdomen is indicative of gastroenteritis].
66.	1337. A man suffers from Herpes Zoster affecting his face. Which of the following mucos membrane is to be affected? a. Cheek b. Cornea c. Conjunctiva d. Oropharynx	The key is C. Conjunctiva. [If maxillary or ophthalmic division is not mentioned but only mentions face it means ophthalmic branch more commonly around eye. Herpes zoster ophthalmicus can cause following lesions blepheritis, conjunctivitis, keratitis, anterior uveitis etc. As question wants mucous membrane

	e. Palate	and among the mentioned lesions only conjunctiva is
	er ranace	mucous membrane the answer is conjunctiva].
67.	1344. A 56yo male presents with persistent watery	The key is C. Cryptosporidium.
07.	diarrhea. What is the most likely dx?	
	a. Treponema pallidum	
	b. Nesseria meningitides	
		DOALE
	d. Staph aureus	R SALE
	e. Pseudomonas aeruginosa	
68.	1350. A 29yo man took a tour of Japan and also	The key is D. Dengue fever.
	travelled to other parts of Asia, developed fever,	and the first of t
	petechie and rash on his body. He didn't take	
	malaria prophylaxis prior to travel. What is the most	
	likely dx?	
	a. Malaria	
	b. HSP	
	c. HIV	
	d. Dengue fever	
	e. ITP	
69.	1352. A 46yo male presents with confusion and	The key is A. Cryptococcus neoform [The key is
	drowsiness. What is the most likely dx?	doubtful as Toxoplasmosis is most common cns
	a. Cryptococcus neoformans	lesion in AIDS],
	b. Toxoplasma gondii	
	c. HSV	
	d. CMV	
	e. Candida albicans	
		Van.
70.	1353. A child has developed rash after the tx of	The key is A. Drug reaction.
	penicillin. What will be the cause of rash?	
	a. Drug reaction	
	b. Kawasaki	
74	c. Inf Mono	
71.	1358. A 3yo boy presents with difficulty in walking	The key is C. Parvovirus. [Sometimes there may
	and skin lesions. What is the most likely causative	occur arthropathy for which children gets difficulty
	agent?	to walk. There occurs macular morbiliform rash in
	a. Strep pyogenes b. Rubella virus	parvovirus infection following disappearance of rash
	c. Parvovirus	of the cheeks].
	d. Papovirus

78.	1451. A 7yo child presents with lesions on the trunk.	The key is B. Varicella zoster.
	Exam: some lesions are weeping and others are	NOALE
	crusted with a red base. What is the causative	
	organism?	
	a. Herpes simplex	
	b. Varicella zoster	

r		
	c. Rubella virus	
	d. Herpes zoster	
79.	1467. A middle aged Asian presents with episodes of fever with rigors and chills for last 1yr. Blood film: ring form of plasmodium with schuffners dots in RBCs. What is the drug to eradicate this infection? a. Doxycycline b. Mefloquine c. Proguanil d. Quinine e. Artesunate	The key is B. Mefloquine which is a wrong key! None of the given option is correct!! [Shuffners dot indicate either vivax or ovale infection and the hepatic cycle only can be eradicated by primaquine. So none of the given drugs are the option!! It is a bad recall].
80.	1483. A pregnant woman returns from Sudan, now presenting with intermittent fever, rigor and seizures. What is the dx? a. TB b. Malaria c. Meningitis d. Lyme disease	The key is B. Malaria. [Intermittent fever is seen in malaria. In meningitis fever is not intermittent].
81.	1485. A man was bitten by a drug addict and comes to the hosp with a wound. What inv should be undertaken? a. Hep C b. Lyme disease c. Hep B d. Syphilis e. Hep A	The key is C. Hepatitis B.
82.	1511. A 27yo man presents to the ED with 2d hx of severe headache and pyrexia (38.9C). CT: petechial hemorrhage in the temporal and inf frontal lobes. What is the most likely dx?  a. Brain abscess  b. Meningococcal meningitis c. Cerebral malaria d. Herpes simplex encephalitis e. New variant CID	The key is D. Herpes simplex encephalitis. [Petechial hemorrhage in the temporal and inferior frontal lobes are characteristic of Herpes simplex encephalitis].
83.	1516. A 38yo woman with hemophilia who received several blood transfusions a few years ago presents with irritability and increasing memory deficit. She is unable to speak properly. He is on anti-TB tx. What is the single most likely dx?  a. Creutzfeldt Jacob disease b. Drug toxicity c. Vascular dementia d. HIV associated dementia e. Space occupying lesion	The key is D. HIV associated dementia. [Blood transfision is the clue for HIV transmission. Immunodeiciency is also responsible for TB].
84.	1518. A pt of tuberculous abscess with the hx of prv abscess drainage presented with fever and tenderness between L2/L3 vertebra. Which is the best inv for this pt?  a. XR	The key is D. MRI. [Vertebral collapse from TB infection is better seen on MRI].

	b. CT	
	c. US	
	d. MRI	
	e. Blood culture	
85.	1592. A previously healthy, 10m female child	The key is D. Measles. [Koplick's spots are
	presents to your clinic with a 1-day history of high	characteristic of measles].
	fever, runny nose and conjunctivitis. The child looks	
	unwell and is irritable. Exam: child's oropharynx	RSAIF
	shows that it is inflammed and there are small white	
	spots on the oral mucosa. Which is the most likely	
	dx?	
	a. Kawasaki disease	
	b. Parvovirus infection	
	c. Herpes zoster	
	d. Measles	
86.	1597. A 30yo woman, G2P1, at 37 weeks gestation	The key is D. Measurement of varicella IgG level. [If
	mentions that her 3-year-old son has just developed	previous infection is doubtful do varicella IgG level].
	chickenpox. She is not certain whether she has had	
	the disease herself. Which is the next step in	
	management?	
	a. Administration of varicella-zoster immune globulin	
	IM	
	b. Measurement of varicella IgM level	
	c. Acyclovir tablets orally	
	d. Measurement of varicella IgG level	
87.	1622. A pt. comes back from India and presents with	AFB Stain [The symptoms and arrival from an
	night sweats and lymphadenopathy. XR:	endemic area for Pulmonary TB suggests the best
	Cavitation. What investigation should be done next?	course of action would be to go for AFB staining via
	a. CT scan	ZN stain].
	b. AFB stain	
	c. Blood culture	
	d. Bronchoscopy

5 PCS 2000C	

11.	64. A 56yo man comes with hx of right sided weakness & left sided visual loss. Where is the occlusion?  a. Ant meningeal artery b. Mid meningeal artery c. Mid cerebral artery d. Carotid artery e. Ant cerebral artery f. Ant communicating artery	The key is d. Carotid artery. [Carotid artery divides to internal and external carotid of which internal continues as middle cerebral ultimately. But just before it becomes middle cerebral internal carotid gives rise to ophthalmic branch. So middle cerebral occlusion may give partial visual loss but not complete mono-ocular blindness. For complete mono-ocular blindness occlusion should be proximal to ophthalmic artery i.e. either in internal carotid or more proximally to carotid artery].
		<ul> <li>i) Middle cerebral artery occlusion: paralysis or weakness of contralateral face and arm (faciobracheal). Sensory loss of the contralatera face and arm.</li> <li>ii) Anterior cerebral artery occlusion: paralysis or weakness of the contralateral foot and leg. Sensory loss at the contralateral foot and leg.</li> </ul>
12.	95. A 56yo lady has developed severe right sided headache which worsens whenever she comes to bright light since the last 4 days. She feels nauseated, but doesn't vomit. What is the most likely dx?  a. SAH b. Brain tumor c. Migraine d. Cluster headache e. Subdural headache	<ol> <li>The key is C. Migraine.</li> <li>It is migraine without aura.</li> <li>Criteria of migraine without aura: ≥5 headaches lasting 4-72 hours + nausea/vomiting (or photo/phono-phobia) + any 2 of: i) unilateral ii) pulsating iii) worsen by routine activity [OHCM, 9<sup>th</sup> edition, page-462].</li> </ol>
13.	109. A 33yo male involved in a street fight presents with bruises and deformity in the upper part ofhis leg. XR shows fx of the neck of fibula. What is the single most associated nerve injury?  a. Sciatic nerve b. Gluteal nerve c. Musculocutaneous nerve d. Lateral peroneal nerve e. Tibial nerve f. Femoral nerve	The key is D. Lateral peroneal nerve. [Lateral peroneal nerve is other name of superficial peroneal nerve].
14.	115. A 4yo boy with a febrile convulsion lasting eight minutes has been given IV lorazepam to control them. What is the single most likely serious side effect?  a. Amnesia b. Anaphylactic shock c. Apnea d. Bronchospasm e. Cardiac arrhythmia	The key is C. Apnoea. [Respiratory depression may occur following lorazepam administration

15.	124. Pt with hx of alcoholism, ataxic gait,	1. The key is B. Thiamine.
15.	hallucinations and loss of memory. He is given	2. The diagnosis is Wernicke's encephalopathy.
	•	3. Points in favour of diagnosis: i) history of
	acamprosate. What other drug can you give with this?	
		alcoholism ii) ataxic gait iii) hallucination iv)
	a. Chlordiazepoxide	memory loss.
	b. Thiamine	
	c. Diazepam	$C \land I \vdash C$
	d. Disulfiram	DALE
1.0	e. Haloperidol	4. The having D. AADI having
16.	145. A 53yo woman presented with pain in the	1. The key is D. MRI brain.
	eye, blurry vision and clumsiness for 3 months. She	2. Diagnosis is multiple sclerosis.
	has a hx of difficulty in swallowing and weakness in	
	her right upper limb 2y ago. What is the inv of	
	choice?	
	a. CSF analysis	
	b. EEG	
	c. EMG	
	d. MRI brain	
47	e. Visual evoked response test	A TILL I T ANIH I
17.	153. A 44yo pt comes with right hemiparesis.	1. The key is E. Midbrain.
	Exam: left sided ptosis and left dilated pupil.	Weber syndrome [presence of ipsilateral
	Where is the lesion?	oculomotor nerve palsy and contralateral
	a. Cerebral infarct	hemiparesis or hemiplagia].
	b. Cerebellar infarct	
	c. Medulla oblongata	
	d. Pons	
10	e. Midbrain	The havin C. Fallaray, this yayana hay Cowert hay
18.	177. A 4yo baby has generalized tonic-clonic	The key is C. Epilepsy. It is wrong key. Correct key
	seizure and fever of 39C. his mother informs you	should be A. Febrile convulsion. [Points in favour:
	that this has happened 3-4x before. What is the	seizers in presence of high fever. Same previous
	most likely dx?	illness indicate seizers during fever which goes
	a. Febrile convulsion	against epilepsy. Though usually febrile convulsion dosen't tend to recur but it can recur as well.
	b. Absence seizures	
	c. Epilepsy	Epilepsy has no relation to fever but is due to
10	d. Partial complex seizure	pathology in brain].
19.	197. A young girl complains of episodic headaches	The key is B. Aspirin. This is a wrong key! Correct
	preceded by fortification spectra. Each episode	key is C. Sumatryptan. [Aspirin though 1st line can
	last for 2-3 days. During headache pt prefers quiet, dark room. What is the tx of choice for acute	cause Reye's syndrome in young girl and that is why Sumatryptan is the better option here].
		why sumatryptants the better option herej.
	stage? a. Paracetamol	
	b. Aspirin	
	c. Sumatriptan d. Gabapentin	
	e. Cafergot

		posterior rossa resion with is preferred].
	a. MRI cerebellum	
	b. CT cerebellum	
	c. Skull XR	
	d. LP	
	e. Blood culture	
25.	225. A 78yo lady on warfarin for atrial fibrillation	The key is C. Subdural haemorrhage. [Age 78 yrs,
	lives in a care home. She presents with hx of	living in a care home where unnoticed trivial injury
	progressive confusion for three days. She was also	is possible (like fall), warfarine and high INR is
	noticed to have bruises on her arms. INR = 7.	potential risk factor of subdural haemorrhage
	What is the most probable dx?	suggested by bruises on arms also].
	a. Alzheimers	UALL
	b. Delirium	
	c. Subdural hemorrhage	
	d. Vascular dementia	
	e. Pick's dementia	
	C. Flore & deliterista	

26.	227. A 32 yo woman suffers an episode of severe occipital headache with vomiting and loss of consciousness. She is brought to the hospital where she is found to be conscious and completely alert. Exam: normal pulse & BP. No abnormal neurological signs. What is the next step in management?  a. Admission for observation b. CT brain c. MRI head d. Reassurance and discharge e. XR skull	The key is B. CT brain. [basilar migraine can cause severe headache and LOC. But there occurs no neurological deficit and on recovering from unconsciousness becomes completely alert. But to diagnose basilar migraine there should at least history of two migraine attacks with aura. As here diagnostic criteria of basilar migraine is not fulfilled we can not discharge the patient without neuroimaging like CT or MRI].
27.	232. A 63 yo female is noted to have left pupil irresponsive to light and is dilated. What is the most .probably dx? a. Pontine hemorrhage b. Subdural hemorrhage c. Cerebellar hemorrhage d. Extradural hemorrhage e. Subarachnoid hemorrhage	The key is D. Extradural hemorrhage. This is a wrong key! Correct key is B. Subdural hemorrhage.
28.	245. A teacher brings in a child who says she fell down after hitting a table. On probing further, you decide that it was most probably an absence seizure. What led you to this dx?  a. The child had not eaten since morning b. The child suddenly went blank and there was uprolling of eyes c. The child started moving his fingers uncontrollably before he fell d. The child's body became rigid and then started to jerk	The key is B. The child suddenly went blank and there was up-rolling of eyes.
29.	248. A 74yo man presents with weakness in his arm and leg from which he recovered within a few days and short term memory loss. He has an extensor plantar response. He has similar episodes 2 years ago and became unable to identify objects and to make proper judgment. What is the most appropriate dx?  a. Alcoholic dementia b. Pick's dementia c. Huntington's disease d. Alzheimer's disease e. Vascular dementia	The key is E. Vascular dementia. [hemiparesis, memory impairment, extensor planter reflex, inability to identify objects, poor judgment are features of vascular dementia].
	NOTFOR	SALE

257. A 29yo woman who was dx to have migraine presents with severe onset of occipital headache. She lost her consciousness. CT=normal. Neurological exam=normal. What is the most appropriate management?  a. Repeat CT  b. MRI  c. LP	<ol> <li>The key is E. No investigation required.</li> <li>The diagnosis is basilar migraine.</li> <li>Points in favour i) history of migraine ii) severe occipital headache iii) LOC iv) CT normal v) neurological examination is normal.</li> </ol>
u. XR	
262. A 6yo girl who has previously been well presented with a hx of tonic-clonic seizures lasting 4mins. Her mother brought her to the hospital and she appeared well. She is afebrile and didn't lose consciousness during the episode of seizure. She has no neurologic deficit. What is the most appropriate inv for her?  a. ABG  b. Serum electrolytes	The key is B. Serum electrolyte.     In epilepsy patient becomes unconscious. The child has no previous illness and she was conscious during the episode of seizure. So electrolyte imbalance may be the cause.
c. ECG	
d. Blood glucose	
confused and had urinary incontinence. She has recovered fully after 6h with no neurological complaints. What is the most likely dx?  a. Stroke b. Vestibular insufficiency c. TIA d. Intracranial hemorrhage	The key is C. TIA.
283. A 47yo man who is a chronic alcoholic with established liver damage, has been brought to the hospital after an episode of heavy drinking. His is not able to walk straight and is complaining of double vision and is shouting obscenities and expletives. What is the most likely dx?  a. Korsakoff psychosis b. Delirium tremens c. Wernickes encephalopathy d. Tourettes syndrome e. Alcohol dependence	The key is C. Wernicke's encephalopathy. [triad of i) ophthalmoplegia, ii) ataxia iii) confusion
295. A 34yo male presents with hx of headache presents with ataxia, nystagmus and vertigo. Where is the site of the lesion? a. Auditory canal b. 8th CN c. Cerebellum d. Cerebral hemisphere e. Brain stem	The key is C. Cerebellum. [Features described are consistent with cerebellar lesion].
	presents with severe onset of occipital headache. She lost her consciousness. CT=normal. Neurological exam=normal. What is the most appropriate management?  a. Repeat CT b. MRI c. LP d. XR e. No inv required  262. A 6yo girl who has previously been well presented with a hx of tonic-clonic seizures lasting 4mins. Her mother brought her to the hospital and she appeared well. She is afebrile and didn't lose consciousness during the episode of seizure. She has no neurologic deficit. What is the most appropriate inv for her? a. ABG b. Serum electrolytes c. ECG d. Blood glucose  263. A 60yo woman was found by her son. She was confused and had urinary incontinence. She has recovered fully after 6h with no neurological complaints. What is the most likely dx? a. Stroke b. Vestibular insufficiency c. TIA d. Intracranial hemorrhage  283. A 47yo man who is a chronic alcoholic with established liver damage, has been brought to the hospital after an episode of heavy drinking. His is not able to walk straight and is complaining of double vision and is shouting obscenities and expletives. What is the most likely dx? a. Korsakoff psychosis b. Delirium tremens c. Wernickes encephalopathy d. Tourettes syndrome e. Alcohol dependence  295. A 34yo male presents with hx of headache presents with ataxia, nystagmus and vertigo. Where is the site of the lesion? a. Auditory canal b. 8th CN c. Cerebellum d. Cerebral hemisphere

35.	300. A 65yo HTN man wakes up in the morning	The key is B. Right internal capsule. [As symptoms
55.	with slurred speech, weakness of the left half of his	are on left side lesion is on right side of the brain.
	body and drooling. Which part of the brain is	So answer should be either b) right internal capsule
	affected?	or c) right midbrain. If it was midbraine there
	a. Left parietal lobe	would have cranial nerve involvement. On the
	b. Right internal capsule	other hand given picture is very much consistent
	c. Right midbrain d. Left frontal lobe	with lacunar infarction of internal capsule!]
36.	332. A man presents with outward deviation of his	The given key is B. Left oculomotor! It is wrong
	right eye and diplopia. Which nerve is affected?	key! As in oculomotor nerve lesion there is
	a. Left trochlear	ipsilateral symptoms so the correct answer is E.
	b. Left oculomotor	Right oculomotor.
	c. Right trochlear	
	d. Right abducens	
	e. Right oculomotor	
37.	334. A 12yo girl presented with tics, LOC, no	The key is C. Partial -> generalized seizure
	residual sign and no post-ictal phase. EEG	
	abnormality in temporal lobe. The girl had a rapid	
	recovery. What is the most probably dx?	
	a. Generalized tonic-clonic	
	b. Myoclonic	
	c. Partialgeneralized seizure	
	d. Atonic seizure	
	e. Febrile convulsion	
38.	348. A 56yo woman with MS presents with	The key is D. Brain stem. Features of 5, 7, 8 <sup>th</sup>
50.	drooping of the left side of her lips. She also has	cranial nerve and cerebellum involvement
	loss of sensation over her face, hearing impairment	suggestive of brainstem lesion.
	and some in-coordination of her movements. What	33,000
	is the most likely anatomical site affected?	
	a. Cerebellum

130.	1550. A 76yo woman presents with deep stroke 6h ago. What would the immediate tx be? a. Aspirin 75mg b. Aspirin 300mg c. Streptokinase d. IV heparin e. Dipyridamole 200mg	The key is B. Aspirin 300mg.

131.	1553. A 50yo man with a known hx of stroke is unable to get out of his house because he can't find where the door is. He refuses help from his wife and says he is not blind. What is the single most likely defect?  a. Paracentral scotoma b. Tunnel vision c. Total blindness d. Central scotoma e. Cortical blindnes	The key is E. Cortical blindness. [Cortical blindness is the total or partial loss of vision in a normal-appearing eye caused by damage to the brain's occipital cortex. Rarely, a patient with acquired cortical blindness may have little or no insight that they have lost vision, a phenomenon known as Anton–Babinski syndrome].
132.	1588. A 45yo man presents with a mass on the right side of the face. The mass was first observed three months ago but has recently become visibly larger. He feels pain over the mass and is unable to blow a whistle. Clinical examination shows that the mass is likely to be the parotid gland. An oral examination shows a foul smelling discharge from the duct of the gland and gentle probing shows that it is stenosed at the meatus. Which of the following features suggests that the mass might be malignant?  a. Presence of pain  b. Recent enlargement  c. Facial nerve palsy  d. Stenosed duct meatus	The key is C. Facial nerve palsy. [Due to malignant infiltration].
133.	1591. A 6yo boy has been noticed to have problems with co-ordinating his voluntary movements over the last two years. He has a waddling gait and needs to support himself on his hands when rising from the floor. He has larger calves than other boys but he runs more slowly. Which is the most likely dx?  a. Myotonia b. Myasthenia gravis c. Duchenne muscular dystrophy d. Muscular atrophy	The key is C. Duchenne muscular dystrophy. [The child having difficulty with walking, running, jumping and climbing stairs. Walking may look different with a 'waddling' type of walk. The boy may be late in starting to walk (although many children without DMD also walk late).  When you pick the child up, you may feel as if he 'slips through your hands', due to looseness of the muscles around the shoulder.  The calf muscles may look bulky, although they are not strong.  As he gets older, the child may use his hands to help him get up, looking as if he is 'climbing up his legs'. This is called 'Gower's sign'].
134.	1645. A 32yo woman has had 3 episodes of slurred speech and 2 episodes of transient weakness of both legs in the past 5yrs. Each episode has resolved in 3m. What is the SINGLE most likely dx? a. Meningioma b. Migraine c. Multiple sclerosis d. Stroke e. Transient ischaemic attack	The key is C. Multiple sclerosis.

5.	89. A 23yo lady was prescribed with azithromycin 1gm for her chlamydial pelvic infection. She hasgot a new boyfriend for the last 2 months. She has recently started contraception to avoid conception. Which of the following contraception method will be affected by azithromycin?  a. Barrier b. IUCD c. POP d. COCP	Q /	None of them! Before it was thought that hepatic enzyme inhibitor drugs may affect COCP but later it was established that actually there is no such significant effect. Only drugs like refumpicin, rifabutin etc. can cause this. [For exam purpose if you have to choose one please choose D. COCP].
6.	100. A 27yo lady has had an uncomplicated pregnancy so far. She came to the hospital 2h ago after her water broke. The midwife is looking at her now. She has regular contractions. P.V exam revealed 2cm dilated cervix. Vital signs are normal. What stage of labour is she in?  a. Second stage b. First stage c. Latent stage d. Third stage e. Active phase		The key is B. First stage starts with softening of cervix with start of opening of cervix and ends when cevix is fully dilated (i.e. 10 cm dilated). [Question is asking stage of labour].
7.	102. A 29yo woman had just delivered a still born vaginally, following a major placental abruption. Choose the single most likely predisposing factor for developing PPH in this lady?  a. Retained product b. DIC c. Fibroid uterus d. Uterine infection e. Large placental site		The key is B. DIC.     Pregnancy itself is a risk factor for DIC.     Placental abruption is a more common cause of DIC.     Other causes of pregnancy related DIC are: eclampsia, retention of a dead fetus, amniotic fluid embolism, retained placenta or bacterial sepsis.
8.	103. A 28yo woman has delivered with rotational forceps after an 8h labor and 3h second stage. Choose the single most likely predisposing factor for PPH for this pt?  a. Atonic uterus b. Cervical/vaginal trauma c. Retained product d. Preterm labor e. Uterine infection		The key is B. Cervical/vaginal trauma. [complication of forceps delivery].
9.	104. A 50yo man has had anterior resection of the rectum for carcinoma. He expressed concerns about control of postop pain in discussions with the anaesthetist before surgery. What is the best management strategy?  a. Oral diclofenac b. Oral codeine c. IM morphine d. IM dihydrocodeine e. Ondansetron oral		The key is C. IM morphine. [Some post operative pain is severe pain which needs strong opioid analgesic].
10.	118. A term baby born to a 30yo woman of blood group A-ve develops severe jaundice within the first 24h of birth. What is the most likely dx? a. Hereditary spherocytosis b. G6PD c. ABO incompatibility d. Rh incompatibility e. Physiological jaundice	SA	The key is D. Rh incompatibility

11.	128. A 38yo woman has delivered after an induced labor	The key is A. Atonic uterus. [Prolonged

49.	478. A 20yo pregnant 32wks by date presents to the antenatal clinic with hx of painless vaginal bleeding after intercourse. Exam: P/A – soft and relaxed, uterus=dates, CTG=reactive. Choose the single most likely dx?  a. Abruption of placenta 2nd to pre-eclampsia b. Antepartum hemorrhage c. Placenta previa d. Preterm labor	The key is C. Placenta previa.
	e. Placenta percreta	$\Lambda$ $\square$ $\square$
50.	483. A 65yo presents with dyspareunia after sex. She in menopause. She complains of bleeding after sex. What is the most probably dx? a. Cervical ca b. Endometrial ca c. Ovarian ca d. Breast ca e. Vaginal ca	The key is B. Endometrial carcinoma. [Any post menopausal bleeding if associated with pain lower abdomen (may be even in the form of dyspareunia) is endometrial carcinoma unless proven otherwise. (even painless vaginal bleeding in post menopausal women is highly suspicious!)].
51.	486. A 24yo primigravida who is 30wk pregnant presents to the labor ward with a hx of constant abdominal pain for the last few hours. She also gives a hx of having lost a cupful of fresh blood per vagina before the pain started. Abdominal exam: irritable uterus, CTG=reactive. Choose the single most likely dx?  a. Abruption of placenta 2nd to pre-eclampsia b. Antepartum hemorrhage c. Placenta previa d. Vasa previa e. Revealed hemorrhage	The key is B. Antepartum hemorrhage. [Though presentation indicates abruption placenta but abrutio placenta 2 <sup>nd</sup> to preeclumpsia can't be the option as no features are suggestive of pre-eclumpsia here. So better option is B. Antepartum hemorrhage which also includes abruption placenta. Only bleeding cannot indicate whether it is concealed, mixed or revealed].
52.	511. A 26yo woman had bipolar disorder for 10yrs and is on Lithium for it. She is symptom free for the past 4 years. She is now planning her pregnancy and wants to know whether she should continue taking lithium. What is the single most appropriate advice? a. Continue lithium at the same dose and stop when pregnancy is confirmed b. Continue lithium during pregnancy and stop when breast feeding c. Reduce lithium dosage but continue throughout pregnancy d. Reduce lithium gradually and stop when pregnancy is confirmed e. Switch to sodium valproate	The key is D. Reduce lithium gradually and stop when pregnancy is confirmed.
53.	519. A 39yo woman has not had her period for 10months. She feels well but is anxious as her mother had an early menopause. Choose the single most appropriate initial inv? a. Serum estradiol conc. b. Serum FSH/LH c. Serum progesterone conc. d. None e. Transvaginal US	The key is B. Serum FSH/LH [here serum oestrogen is also important as i) low oestrogen + low FSH + low LH suggest hypothalamic amenorrhoea and i) low oestrogen + high FSH + high LH suggest premature ovarian failure! So the main determinant is serum FSH/LH. Likely cause here is premature ovarian failure].

		1	T
54	, ,		The key is B. Abdominal US. This is a wrong
	pregnancy otherwise seems to be normal. What should be		key. The correct key is A. Vaginal

Probably key is suggesting how this prescribed procedure would work by helping her IUCD wich helps to prevent implantation not to get pregnant. and not the pills as both the available pill a. It helps to prevent implantation causes a delay in ovulation. [The time b. It helps in preventing or delaying ovulation required for the egg to travel to the uterus c. It causes an early miscarriage and implant is usually between 7 and 10 d. It releases progesterone and stops ovulation days]. [There are two types of pill: e. It causes local enzymatic reaction 1. 1.5 mg of levonorgestrel pill. It should be taken within 72 hours (three days). It is thought to work mainly by preventing or delaying the release of an egg from your ovary, which normally happens each month (ovulation). 2. Ulipristal acetate (brand name ellaOne®) is a type of emergency contraceptive pill that was launched in the UK in 2009. It is taken as one single tablet. Take the pill as soon as possible after unprotected sex. The earlier you take the pill, the more effective it is. It can be taken up to 120 hours (five days) after having unprotected sex. It is a type of hormone which seems to work by stopping or delaying release of an egg (ovulation). IUCD prevent implantation. As she is sexually active hymen is ruptured and IUCD can be given to her. But with IUCD chance of ectopic pregnancy is much more!]. NOT FOI

	QUESTIONS	ANS	DR. KHALID'S EXPLANATION
1.	27. A young boy fell on his outstretched hand and has presented with pain around the elbow. He has absent radial pulse on the affected hand. What is the most likely dx? a. Dislocated elbow b. Angulated supracondylar fx c. Undisplaced fx of radial head d. Posterior dislocation of shoulder	0	The key is B. Angulated supracondyllar fx. [Damage or occlusion of the bracheal artery is the cause of absent radial pulse. Often closed reduction results in restoration of normal anatomy and correction of occlusion of bracheal artery and establishes circulation again but in few instances open reduction is required to fix the occluded artery].
2.	48. A 79yo stumbled and sustained a minor head injury 2 weeks ago. He has become increasingly/confused, drowsy and unsteady. He has a GCS of 13. He takes warfarin for Afib. What is the most likely dx? a. Extradural hemorrhage b. Cerebellar hemorrhage c. Epidural hemorrhage d. Subdural hemorrhage e. Subarachnoid hemorrhage		1. The key is D. Subdural hematoma. [In elderly head injury usually leads to subdural hematoma even if head injury is minor or trivial and extradural hematoma in elderly is extremely uncommon even in more severe head injury. Management: 1st line: Evacuation by barr hole craniostomy. 2nd line: Craniotomy if the clot is organized
3.	53. A 23yo woman has been having pain at the base of her thumb, the pain is reproduced when lifting her 3 month old baby or changing diapers and also with forceful abduction of the thumb against resistance. What is the likely cause? a. Avascular necrosis of scaphoid b. Trigger finger. c. De Quervain's tenosynovitis		The key is c. De Quervain's tenosiovitis. [Can be diagnosed by Finkelstein's test:  The physician grasps the thumb and the hand is ulnar deviated sharply. If sharp pain occurs along the distal radius (top of forearm, about an inch below the wrist), de Quervain's syndrome is likely].
4.	135. A 37yo man slipped while he was walking home and fell on his out stretched hand. He complains of pain in the right arm. XR showed fx of the head of radius. What is the single most associated nerve injury?  a. Radial nerve b. Musculocutaneous nerve c. Median nerve d. Ulnar nerve	4	<ol> <li>The key is A. Radial nerve. [At wrist, radial nerve injury cause finger drop with a normal wrist and intact sensation].</li> <li>Root value of radial nerve: C5,6,7,8 and T1.</li> </ol>
5.	152. A 23yo man has been stabbed in the back and has SOB. The trachea is not deviated, he has engorged neck veins and absent breath sounds on the right. What is the most appropriate dx?  a. Tension pneumothorax b. Cardiac tamponade c. Simple pneumothorax d. Hemothorax e. Pleural effusion	0	1. The key is A. Tension pneumothorax. 2. Points in favour: i) Stab wound in the back ii) SOB iii) Engorged neck vein iv) Absent breath sound. These features are common for both hemothorax and tension pneumothorax and tracheal deviation is common to both! But chance of tension pneumothorax is more in stab wond and no tracheal deviation is controversial. This is probability of bad recall!!

6.	161. A 78yo male, DM and HTN, had a fall and since then is unable to walk. He presents withdeformity and tenderness over the right hip area. XR=fx of femur neck. What is the single most associated nerve injury?		The key is A. Sciatic nerve. [Sciatic nerve injury though may occur but may not be very common!]
	a Sciatic nerve	0	RSALE
7.	162. A 20yo man has a head on collision in a car. On presentation he is breathless, has chest pain and fx of 5-7th rib. CXR confirms this. What is the most appropriate initial action in this pt?  a. Antibiotics b. Analgesia c. O2 by mask		The key is C. O2 by mask. [There was debate in this forum that pain relief should be given first which will automatically relieve breathing problem. But others told O2 first]. O2 first is the correct answer!
	d. Physiotherapy e. Refer to surgeon		
8.	191. A 37yo female had a fall with outstretched hand, presented with dinner fork deformity and tenderness over the right arm. What is the single most associated nerve injury?  a. Axillary nerve b. Radial nerve c. Musculocutaneous nerve d. Median nerve e. Ulnar nerve		The key is D. Median nerve. [Median nerve is the nerve injured in Colle's fracture].
9.	199. A 33yo man is hit by a car. He loses consciousness but is found to be fine by the paramedics. When awaiting doctors review in the ED he suddenly becomes comatose. What is the most likely dx?  a. SAH  b. Subdural hemorrhage  c. Intracerebral hemorrhage  d. Extradural hemorrhage	d	The key is D. Extradural haemorrhage. [Age 33 (younger age), considerable head trauma, and lucid interval (present in both extradural and subdural) are the points in favour].
10.	212. A 47 yo man met with a RTA. He has multiple injuries. Pelvic fx is confirmed. He has not passed urine in the last 4 hrs. What is the next appropriate management for this pt?  a. Urethral catheter b. Suprapubic catheter c. IV fluids d. IV furosemide e. Insulin	0	1. The key is B. Suprapubic catheter. 2. In pelvic fracture there is chance of urethral rupture and hence displacement of urethral catheter while try to place it.  RSALE

	T	1	
11.	220. A footballer has been struck in the		The key is C. Exploratory surgery. [To exclude torsion].
	groin by a kick and a presents with severe		
	pain and mild swelling in the scrotum. What		
	is the most appropriate next step?		
	a. USG

	c. Pneumonia		
	d. Tension pneumothorax	1	
	e. Empyema		

22.	444. A 15yo boy presents with a limp and pain in the knee. Exam: leg is externally rotated and 2cm shorter. There is limitation of flexion, abduction and medial rotation. As the hip is flexed external rotation is increased. Choose the most likely dx?  a. Juvenile rheumatoid arthritis b. Osgood-schlatter disease c. Reactive arthritis d. Slipped femoral epiphysis e. Transient synovitis of the hip	0	The key is D. Slipped femoral epiphysis. [The given presentation is classic for slipped femoral epiphysis].
23.	453. Which of the following formulas is used for calculating fluids for burn pts?  a. 4 x weight(lbs) x area of burn = ml of fluids  b. 4 x weight(kgs) x area of burn = L of fluids  c. 4 x weight(kgs) x area of burn = ml of fluids  d. 4 x weight(lbs) x area of burn = L of fluids  e. 4.5 x weight(kgs) x area of burn = dL of fluids		The key is C. 4 x weight(kgs) x area of burn = ml of fluids.
24.	508. A 50yo man presents to the ED with acute back pain radiating down to his legs. Pain which is usually relieved by lying down and exacerbated by long walks and prolong sitting. What inv would be the best option?  a. MRI b. CT spine c. XR spine d. Dual energy XR abruptiometry e. Serum paraprotein electrophoresis		The key is A. MRI. [Back pain radiating to leg, pain releaved by lying down and exacerbated by long walk and prolonged sitting are characteristic of lumber (intervertebral) disc disease].
25.	517. A 60yo woman presents with acute onset of bone and back pain following a rough journey in a car. Exam: tenderness at mid-thoracic vertebra with spasm, she feels better once she bends forward. What is the single most probable dx?  a. Osteoporotic fx verterbra b. Myofacial pain c. Whiplash injury d. MI e. Pancreatitis	4	The key is B. Myofacial pain. [Myofascial pain syndrome is a chronic pain disorder. In myofascial pain syndrome, pressure on sensitive points in your muscles (trigger points) causes pain in seemingly unrelated parts of your body. This is called referred pain. Myofascial pain syndrome typically occurs after a muscle has been contracted repetitively].
26.	566. A 6yo came with full thickness burn. He is crying continuously. What is the next step of management?  a. Refer to burn unit b. IV fluid stat c. Antibiotic d. Analgesia e. Dressing	0	The key is analgesia. This is a wrong key. Correct key should be B. IV fluid stat. [Here already mentioned full thickness burn which is painless. Child often cry from anxiety for hypoxaemia and hypovolaemia rather than pain. The patient then responds better to oxygen or increased fluid administration rather than to narcotic analgesics. Ref: patient.info].

27.	570. An 18m boy has been brought to the ED because he has been refusing to move his left arm and crying more than usual for the past 24h. He has recently been looked after by his mother's new bf while she attended college. Assessment shows multiple bruises and a fx of the left humerus which is put in plaster. What is the single most appropriate next step?  a. Admit under care of pediatrician b. Discharge with painkillers c. Follow up in fx clinic d. Follow up in pediatric OPD e. Follow up with GP	0	Ans. The key is A. Admit under care of pediatrician. [This is NAI. So the child cannot be handover to the risk again and should be admitted to protect him from further injury done by mothers boyfriend while serial x-rays and relevant investigations done and asked for child protection unit's help].  RSALE
28.	573. A 14yo boy fell and hit his head in the playground school. He didn't lose consciousness. He has swelling and tenderness of the right cheek with a subconjuctival hemorrhage on his right eye. What is the most appropriate initial inv?  a. CT brain b. EEG c. MRI d. Skull XR e. Facial XR		The key is E. Facial X-ray. This is a wrong key Correct key is A. CT brain. [With the risk of basal fracture we should do CT scan to diagnose this. In present case CT is better than MRI. Skull X-rays are no longer recommended as first line investigation].
29.	604. A 12yo boy with a hx of fall on an outstretched hand was brought to the ED with swelling and pain around the elbow. His radial nerve was affected. What is the type of fx?  a. Angulated fx b. Epiphyseal fx c. Compound fx d. Spiral fx		The key is D. Spiral fracture. It is wrong key. The correct option should be A. Angulated (supracondylar fracture). [Around 50% interosseous nerve lesions occur in supracondylar fracture whereas 25% shows radial nerve damage. If the fracture is spiral fracture of lower third of humerus it causes nerve damage in 18% almost all of which are radial nerve lesion. However as the fracture is around the elbow (not above) it is supracondylar fracture].
30.	610. A 62yo man with rheumatoid arthritis struck his hand against a door. He subsequently found that although he could extend the interphalangeal joint of his right thumb, the MCP joint of the thumb remained flex. What is the single most likely tendon to have been damaged?  a. Extensor carpi ulnaris b. Extensor digitorum c. Extensor indicis d. Extensor pollicis brevis e. Extensor pollicis longus	0	The key is D. Extensor pollicis brevis. [Action of extensor pollicis brevis = extension of thumb at metacarpophalangeal joint. Extensor pollicis longus = extends the terminal phalanx of the thumb].

F:			
31.	623. A 16yo boy following a RTA was brought to the ED with a swelling and		The key is A. Femoral artery.
	deformity in his right thigh. Exam: airway is		
	patent and is found to have a pulseless leg.		
	Which structure is involved in this fx?		
	a. Femoral artery		
	b. Posterior tibial artery		$D \cap A \cup E$
	c. Common peroneal nerve		RSALE
	d. Dorsalis pedis		
32.	666. A 68yo woman is unable to extend the		The key is C. Extensor policis longus. [Full extension of right
	IP joint of her right thumb 7wks following a		thumb is achieved by extensor pollicis longus].
	fx of the right radius. Other finger and		
	thumb movements are normal. What is the		
	single most likely tendon to be damaged?		
	a. Abductor pollicis longus		
	b. Extensor pollicis brevis		
	c. Extensor pollicis longus		
	d. Flexor digitorum profundus		
	e. Flexor pollicis longus		
33.	693. A 73yo woman with RA is unable to		The key is C. Extensor digitorum. [The extensor digitorum
	extend the fingers of her right hand at the		extends the phalanges, then the wrist, and finally the elbow. It
	MCP joint and IP joints following a fall. What		acts principally on the proximal phalanges].
	is the single most likely tendon to have been		
	damaged?		
	a. Extensor carpi radialis		
	b. Extensor carpi ulnaris		
	c. Extensor digitorum		
	d. Extensor indicis		
	e. Flexor digitorum profundum		
34.	695. A 58yo man has a headache and		The key is C. CT brain. [The likely diagnosis is subdural
	confusion of 3 days after slipping and hitting		haematoma for which appropriate initial investigation is CT
	his head in the garden. What is the most		scan of brain].
	appropriate initial inv?

80.	1683. A mother brings her 1yo infant to her pediatrician. She describes that following a common cold her child's voice has become hoarse and has developed a cough that sounds harsh and brassy and was worse at night. Exam: the child was noted to have trouble drawing air into its lungs between coughs and had trouble drawing air into its lungs. There was visible stridor on inhalation. The cause is most likely to be?  a. EBV  b. Rhinovirus  c. Parainfluenza  d. Flavivirus  e. HIV  f. Rotavirus	Parainfuenza. [Parainfluenza virus causes croup. A rough barking cough with hoarsness and wheezing, labored breathing, runny nose, fever, cough, decreased appetitie are common features].
01	g. CMV h. Kemerovo i. Creutzfeld-Jacob j. Rubella 1685. An infant has diarrhea for 3d with weight loss	The key is C. Lastated Binger's injection
81.	from 10 kg to 9 kg. Exam: he is noted to have dry mucous membranes, poor skin turgor, markedly decreased urine output, and tachycardia. His BP=normal and compression-release of the nail beds shows satisfactory refilling. Appropriate treatment would include?  a. Plasmapheresis and plasma infusion b. 0.5% Normal Saline c. Lactated Ringer's injection d. Packed cells e. Whole blood f. Platelets g. FFP h. double strength Normal Saline i. 5% dextrose in 0.5N saline solution j. IV heparin	The key is C. Lactated Ringer's injection.
82.	1704. An 18m girl who has had single UTI is seen in the OPD. She has fever and vomiting but these improved with course of trimethoprim. Subsequently, MCUG showed bilateral vesicoureteric reflux. Single most appropriate mgmt?  a. Prophylactic antibiotics b. Reassure c. No treatment d. Ureteric surgery	The key is D. Ureteric surgery. This is wrong key. Correct key is prophylactic antibiotics. [Usually most of the cases of VUR cures with advancing age with antibiotic prophylaxis and only a minority need surgery].

	QUESTION	EXPLANATION BY DR. KHALID	OLD KEY
1.	5. A 64yo man has recently suffered from an MI and is on aspirin, atorvastatin and ramipril. He has been having trouble sleeping and has been losing weight for the past 4 months. He doesn't feel like doing anything he used to enjoy and has stopped socializing. He says he gets tired easily and can't concentrate on anything. What is the most appropriate tx?  a. Lofepramine b. Dosulepin c. Citalopram d. Fluoxetine e. Phenelzine	The key is C. Citalopram. [Among SSRIs Sertraline is the drug of choice for ischemic heart disease. Next choice is citalopram (as it is often related to torsades de pointes). If SSRI cannot be used Mirtazapine is recommended as next antidepressant].	
2.	31. A 45yo man keeps having intrusive thoughts about having dirt under the bed. He can't keep himself from thinking about these thoughts. If he tries to resist, he starts having palpitations. What is the most likely dx?  a. OC personality b. OCD c. Schizophrenia d. Panic disorder e. Phobia	The key is B. [Here patients thoughts are obsession and though no compulsive act is described (like repeated cleansing of dirt) but his nature of thought like inability to resist the thinking or getting palpitation on trying to avoid thinking can be regarded as compulsion of thought. CBT 1st line. SSRIs].	
3.	36. A 37yo lady strongly believes that a famous politician has been sending her flowers every day and is in love with her. However, this is not the case. What is the most likely dx?  a. Erotomania b. Pyromania c. Kleptomania d. Trichotillomania e. Grandiosity	The key is A. Erotomania. [Erotomania is a type of delusion in which the affected person believes that another person, usually a stranger, high-status or famous person, is in love with them].  Pyromania is an impulse control disorder in which individuals repeatedly fail to resist impulses to deliberately start fires, in order to relieve tension or for instant gratification.  Kleptomania is the inability to refrain from the urge to steal items.  Trichotillomania is an impulse disorder characterized by the compulsive urge to pull out one's hair, leading to noticeable hair loss and balding.  Grandiosity refers to an unrealistic sense of superiority.	
4.	56. A 35yo man with a hx of schizophrenia is brought to the ER by his friends due to drowsiness. On examination he is generally rigid. A dx of neuroleptic malignant syndrome except:  a. Renal failure  b. Pyrexia  c. Elevated creatinine kinase  d. Usually occurs after prolonged tx  e. Tachycardia	The key is D. Usually after prolonged tx. [Malignant neuroleptic syndrome usually occurs SOON after start or in increasing dose of antipsychotic drugs! All others mentioned are seen in this syndrome like renal failure, pyrexia, elevated creatinine kinase, tachycardia etc].	

5.	57. A 33yo drug addict wants to quit. She says she is ready to stop the drug abuse. She is supported by her friends and family. What drug tx would you give her?  a. Benzodiazepines b. Diazipoxide c. Lithium d. Methadone e. Disulfiram	1. Key is d. Methadone. (used in opiate abuse) 2. i) tobacco abuse: a) bupropion ii) alcohol: a) acamprosate b) disulfirum   RSALE
6.	80. A 35yo male is bitterly annoyed with people around him. He thinks that people are putting ideas into his head. What is the single most likely dx?  a. Thought block b. Thought insertion c. Thought broadcasting d. Thought withdrawal e. Reference	The key is B. Thought insertion. It is seen in schizophrenia.
7.	84. A 54yo man has recently been dx with moderate depression. He has hx of MI and is suffering from insomnia. What is the drug of choice for him? a. Citalopram b. Lofepramine c. ECT d. Haloperidol e. Diazepam	Key is A. Citalopram. [Sertraline is the drug of choice in post MI as citalopram may be a risk factor for precipitating torsades-de-pointes. But if sertraline is not in option second choice is citalopram and where SSRIs are not suitable next choice is mirtazapine].
8.	91. A 35yo man who has served in the army presents with lack of interest in enjoyable activities and feeling low. He doesn't feel like reading the news or watching movies as he believes there is violence everywhere. What is the most appropriate first line therapy?  a. Citalopram  b. Lofepramine  c. CBT  d. Chlordiazepoxide  e. Desensitization	1. The key is C. CBT 2. The diagnosis is mild depressive illness. 3. In mild depressive illness CBT is preferred option.
9.	129. A 32yo woman in tears describing constant irritability with her 2 small children and inability to relax. She describes herself as easily startled with poor sleep and disturbed nightmares following a house fire a year ago, while the family slept. What is the single best tx?  a. Rassurance b. Relaxation therapy c. Quetiapine d. Lofepramine e. Fluoxetine	1 The key is E. Fluoxetine. [NICE guidelines suggest that trauma-focussed psychological therapies (CBT or EMDR) should be offered before medication, wherever possible. As these are not in option the best answer here is Fluoxetine (SSRI). At present, there is evidence that EMDR, psychotherapy, behaviour therapy and antidepressants are all effective. There is not enough information for us to say that one of these treatments is better than another].  2. The diagnosis is post-traumatic stress disorder.

10.	132. A pt with thought disorder washes hands 6x each time he uses the toilet. What is the best management? a. Psychodynamic therapy b. CBT c. Antipsychotics d. Refer to dermatology e. Reassure	3. Points in favour of PTSD: i) H/O stressor (house fire a year ago) ii) Nightmares of the stressor iii) Hyper arousal (very anxious and inability to relax (leading to irritability) iv) associated depression (poor sleep, tearful).  Note: Fluoxetin and peroxetin are the drugs of choice in PTSD. CBT is the non-pharmacological treatment.  1. The key is B. CBT. [For OCD CBT is the 1 <sup>st</sup> treatment of choice and if fails comes drugs].  2. The diagnosis is obsessive compulsive disorder.
11.	138. A 78yo man is depressed after his wife's death. He has been neglecting himself. His son found him in a miserable state when he went to visit. The son can't deal with his father. What is the appropriate management?  a. Voluntary admission to psychiatry ward b. Hand over to social worker  c. Request son to move in with father  d. Send pt to care home	The key is A. Voluntary admission to psychiatry ward.  [This is much too a controversial question!! Patient is neglecting himself and is in a miserable state. His son can't deal with the patient! So it seems impossible for care home staff to deal with him and social worker as well. If son move in with father will be of no benefit as he cannot deal with the patient. So voluntary admission to psychiatry ward is the only option to which we can look but still with doubt as whether he is able to understand or give consent for voluntary admission.  Even though A seems to be the likely option!!]
12.	201. A 29yo teacher is involved in a tragic RTA. After that incident, he has been suffering from nightmares and avoided driving on the motorway. He has been dx with PTSD. What is the most appropriate management? a. CBT b. Diazepam c. Citalopram d. Dosalepin e. Olanzepin	The key is A. CBT. [CBT is the treatment of choice in PTSD].
13.	206. A 23 yo girl presented with perioral paresthesia and carpopedal spasm 20 mins after a huge argument with her boyfriend. What is the next step for this pt?  a. SSRI  b. Diazepam  c. Rebreath into a paper bag  d. Propranolol  e. Alprazolam	1. The key is C. Rebreathin in paper bag. [Hyperventilation causes CO2 washout and respiratory alkalosis. If you continue breathing and rebreathing in paper bag it will allow CO2 concentration to rise in paper bag and as you rebreath this again and again you will regain some washed out CO2 and thus relief to this alkalosis].  2. The girl may have anxiety disorder when it precipitates leads to hyperventilation syndrome.

14.	207. A 25 yo woman has been feeling anxious and nervous for the last few months. She also complains of palpitations and tremors. Her symptoms last for a few minutes and are very hard to control. She tells you that taking alcohol initially helped her relieve her symptoms but now this effect is wearing off and she has her symptoms even after drinking alcohol. What is the dx?  a. Panic disorder  b. Depression  c. OCD  d. Alcohol addiction	The key is A. Panic disorder.  RSALE
15.	e. GAD  208. A 2yo child is very naughty. His teacher complains that he is easily distracted. His parents say that he can't do a particular task for a long time. He sometimes hurts himself and breaks	The key is C. ADHD (Attention deficit hyperreactive disorder).
	many things. This causes many troubles at home. What is the dx? a. ASD b. Dyslexia c. ADHD d. Antisocial personality disorder e. Oppositional defiant	
16.	214. In a man who is neglected and alcohol dependent whith high suicidal risk, which factor can increase this risk further? a. Alcohol dependence b. SSRI c. Smoking d. Agoraphobia e. Court involvement	The key is A. Alcohol dependence. This is wrong key!! Correct key should be B. SSRI. [He is already alcohol dependent. So further (additional) risk factor is SSRI (SSRI has well known risk of developing suicidal ideation].
17.	215. A 71 yo man presents with coarse tremor. He is on some meds. Which one can be the reason for the tremor? a. Lithium b. Diazepam c. Fluoxetine d. Imipramine e. Haloperidol	The key is A. Lithium. Actually in therapeutic dose lithium causes fine tremor but in toxic dose it causes coarse tremor. So the probable answer is lithium.
18.	221. A 47 yo ex-soldier suffers from low mood and anxiety. He can't forget the images he faces before and has always had flashbacks. He is not able to watch the news because there are usually some reports about war. What is he suffering from?  a. Depression b. PTSD c. Panic attack d. Agoraphobia e. GAD	The key is B. PTSD. [repeated flashbacks and tendency to avoid the thoughts of stressor is diagnostic of PTSD].

19.	222. A 36 yo woman has recently spent a lot of money on buying clothes. She goes out almost every night with her friends. She believes that she knows better than her friends, so she should choose the restaurant for eating out. She gave hx of having low mood at 12 yo. What's the dx?  a. Mania b. Depression c. Bipolar affective disorder d. Borderline personality disorder	The key is C. Bipolar affective disorder. [Initial depressive episode (may be befor a long) followed by mania is bipolar affective disorder].  RSALE
20.	e. Dysthymia  228. A 25 yo woman was brought to the ED by her boyfriend. She has many superficial lacerations on	The key is D. Borderline personality disorder.  [Borderline personality disorder: Act impulsively and
	her forearm. She is so distressed and constantly says her boyfriend is going to end the relationship. She denies trying to end her life. What is the most likely dx?  a. Acute psychosis b. Severe depression c. Psychotic depression d. Borderline personality disorder e. Schizophrenia	develop intense but short-lived emotional attachment to others. They are usually attention seekers but not suicidal].
21.	233. A 28yo business executive presents at the GP asking for some help because she has been arguing with her boyfriend frequently. She is worried about her weight, and she thinks she may be fat. She has been on a diet and lost 7 kgs in the last 2 months on purpose. She is eating less. She used to do a lot of exercise. Now she says she's feeling down, has some insomnia and feels tired and without energy. She has not showed up at work. She is worried because recently she got a loan to buy a luxury car. She can't be fired. She complains about her low mood. She thinks this is weird because she used to be extremely productive. She used to work showing an excellent performance at the office. She even received compliments from her boss. How, she says her boyfriend is angry because her apartment is a chaos. Usually she spends a lot of time cleaning it, even upto 3 AM. She liked it to be perfect, but not it's a mess. On exam: BMI=23, no other signs.	The key is B. Bipolar disorder. [Now she is depressed but before hypomanic which makes the likely dx of bipolar disorder].  RSALE

22.	235. A 37 yo man who has many convictions and has been imprisoned many times has a hx of many unsuccessful relationships. He has 2 boys but doesn't contact them. What is the most probable dx?  a. Borderline personality disorder b. Schizophrenia c. Avoidant personality disorder d. Histrionic personality disorder e. Antisocial behavior disorder	The key is E. Antisocial behavior disorder. [Antisocial personality disorder is a particularly challenging type of personality disorder, characterised by impulsive, irresponsible and often criminal behavior].
23.	240. A young female who has many superficial lacerations was brought into the ED by her boyfriend for superficially lashing her upper arm. She is adamant and screaming that she is not suicidal but scared her boyfriend wants to leave her. What is the dx?  a. Acute psychosis b. Severe depression c. Obsessive d. Bipolar e. Borderline personality f. Schizophrenia	The key is acute psychosis. Probably this is wrong key! Correct key should be E. Borderline personality disorder. [Borderline personality disorder (BPD), also known as emotionally unstable personality disorder, is a long term pattern of abnormal behavior characterized by unstable relationships with other people, unstable sense of self, and unstable emotions.[3][4] There is often an extreme fear of abandonment, frequent dangerous behavior, a feeling of emptiness, and self- harm].
24.	241. A 22yo woman was brought by her boyfriend with multiple superficial lacerations. There are scars of old cuts on her forearms. She is distressed because he wants to end the relationship.  She denies suicide. What is the most likely dx?  a. Acute psychosis b. Borderline personality disorder c. Severe depression d. Schizoid personality e. Psychotic depression	The key is B. Borderline personality. [Borderline personality disorder (BPD), also known as emotionally unstable personality disorder, is a long term pattern of abnormal behavior characterized by unstable relationships with other people, unstable sense of self, and unstable emotions.[3][4] There is often an extreme fear of abandonment, frequent dangerous behavior, a feeling of emptiness, and self-harm].
25.	242. A 31yo single man lives with his mother. He usually drives to work. He always thinks when the traffic lights change, his mother is calling him, so he drives back home. What is the dx?  a. OCD  b. GAD  c. Schizophrenia d. Bipolar e. Cyclothymia	The key is C. Schizophrenia. [ delusion of reference - he thinks that the changing traffic lights are giving message to him].
26.	249. A nurse comes to you saying that she has recently developed the habit of washing her hands after every 15-20 mins. She is unable to conc on her work and takes longer than before to finish tasks as she must constantly wash her hands. What is the most appropriate management?	1. The key is A. CBT. 2. The diagnosis is OCD.

		CHIATIVI
	a. CBT	
	b. SSRI	
	c. ECT	
	d. Antipsychotics	
	e. Desensitization	
27.	253. A 70yo lady presents with fever for 3d and	The key is A. Delirium. Delirium is an acute confusional
	confusion. There is no significant PMH. What is the	state and declined cognitive function which involves
	most probable dx?	changes in arousal (hyperactive, hypoactive or mixed),
	a. Delirium	perceptual deficits, altered sleep-wake cycle, and
	b. Hypoglycemia	psychotic features such as hallucinations and delusions.
	c. Alzheimers	
	d. DKA	
28.	255. A 28yo business man came to the sexual	The key is B. Hypochondriac. [worry about having a
	clinic. He was worried that he has HIV infection. 3	serious illness].
	HIV	
	tests were done and all the results are negative.	
	After a few months, he comes back again and	
	claims that he has HIV. What is the dx?	
	a. Somatization	
	b. Hypochondriac	
	c. Mancheusens	
	d. OCD	
	e. Schizophrenia	
29.	258. A 19yo man has been happier and more	1. The key is E. Hypomania.
	positive than usual, with more energy than he has	2. i) elevated mood ii) more energy than before iii)
	ever felt before for no particular reason. He has	getting more work done at the office (loss of inhibition).
	been getting more work done at the office today	These features are common for both mania and
	and has been socializing with his friends as usual.	hypomania!! Then why it is not mania? It is not mania
	What is the most likely dx?	as in mania you will get psychotic symptoms like i)
	a. Atypical depression	delusion of grandeur ii) auditory hallucinations, which
	b. Marked depression	are absent here!
	c. Bipolar syndrome	
	d. Psychosis	
	e. Hypomania	
	S. Hypomania	
30.	259. A 35yo female attempts suicide 10x. There is	The key is A. Problem focused tx. [patient is not
	no hx of psychiatric problems and all neurological	psychotic and with normal neurology! So she may
	exams are normal. What is the best tx?	getting some problem in family life, finance, job or
	a. Problem focused tx	somewhere like this which she is not able to cope with
	b. CBT	and that is leading to her suicidal thoughts].
	c. Antipsychotic	and that is reading to her salidadi thoughts.
	d. Antidepressant	
	e. ECT	
31.	264. A 34yo woman presents 3 weeks after	1. The key is A. ECT.
J1.	childbirth. She has had very low mood and has	2. The diagnosis is post purtum psychosis.
	been	3. Points in favour: i) onset 3 weeks after childbirth ii)
	suffering from lack of sleep. She also has thought	Depressive symptoms (very low mood, insomnia) iii)
	of harming her little baby. What is the most	thought of harming her little baby.
		thought of narming her little baby.
	appropriate management for this pt?  a. ECT	
	b. CBT	
	c. IV haloperidol	
	d. Paroxethine	

	e. Amitryptiline	
32.	278. A 36yo man walks into a bank and demands money claiming he owns the bank. On being denied, he goes to the police station to report this. What	The key is E. Delusion of grandeur.
	c. Delusion of guilt d. Delusion of persecution	RSALE
33.	e. Delusion of grandeur  281. An old man comes to the doctor complaining that a part of this body is rotten and he wants it removed. What is the most likely dx?  a. Guilt b. Hypochondriasis c. Munchausen's d. Nihilism e. Capgras syndrome	The key is D. Nihilism. [nihilism (medical term is nihilistic delusion): parts of the body do not exist or are dead]  Guilt: an emotion that occurs when a person feels that they have violated a moral standard.  Hypochondriasis: worry about having a serious illness.  Munchausen's: a psychiatric factitious disorder wherein those affected feign disease, illness, or psychological trauma to draw attention, sympathy, or reassurance to themselves.  Capgras syndrome: a delusion that a friend, spouse, parent, or other close family member (or pet) has been replaced by an identical-looking impostor.
34.	302. A woman presents with complains of abdominal pain, unsteadiness, numbness of lower limb and palpitations. All inv are normal. What is the dx?  a. Manchausen b. Somatization c. Hypochondriac d. Bipolar	The key is B. Somatization. [This is multiple, recurrent, medically unexplained symptoms usually starting early in life. Usually patient presents with one symptom at a time. Investigations are normal].
35.	316. A 28 yo female who delivered 6 weeks ago feels sad and has no interest to feeding the baby. She has been eating poorly and having difficulty sleeping. She feels weak throughout the day and has stopped taking the baby out of the house. She also says that the baby has evil eyes. What is the most likely diagnosis?  a. Postpartum blues b. Postpaetum depression c. Postpurtum psychosis d. Schizophrenia e. Psychotic depression	1. The key is C. Postpartum psychosis. 2. Points in favour: i) features of depression: feels sad, poor eating, difficulty sleep, feeling weak ii) delusional ideas: thinks baby has evil eyes and not taking the baby out of the house. These points to postpartum psychosis. [Postpartum psychosis starts within 2 wks (occasionally later) of delivery and it can take 6 -12 months or more to recover from postpartum psychosis].
36.	337. A pt with alternating swings or episodes from elation and depression had underwent tx and gotten better. What medication needed to be continued so he can stay well?  a. Anxiolytics	The key is B. Mood stabilizers [bipolar disorder treated with mood stabilizers].

		CHIATRI
	<ul><li>b. Mood stabilizers</li><li>c. Antidepressants</li><li>d. Antipsychotics</li></ul>	
37.	404. A man is very depressed and miserable after his wife's death. He sees no point in living now that his wife is not around and apologises for his existence. He refuses any help offered. His son has brought him to the ED. The son can't deal with the father any more. What is the most appropriate next step?  a. Voluntary admission to psychiatry ward b. Compulsory admission under MHA c. Refer to social services d. Alternate housing e. ECT	The key is B. Compulsory admission under MHA. [This patient is refusing any help offered! And his son cannot deal with him anymore! In this situation voluntary admission to psychiatry ward is not possible and the option of choice is "compulsory admission under MHA". The point here is the man has felt himself in danger by self neglect].
38.	411. A 19yo boy is brought by his mother with complaint of lack of interest and no social interactions.  He has no friends, he doesn't talk much, his only interest is in collecting cars/vehicles having around 2000 toy cars. What is the most appropriate dx?  a. Borderline personality disorder b. Depression c. Schizoaffective disorder d. Autistic spectrum disorder	The key is D. Autistic spectrum disorder. Autism spectrum disorders affect three different areas of a child's life:  Social interaction Communication both verbal and nonverbal Behaviors and interests In some children, a loss of language is the major impairment. In others, unusual behaviors (like spending hours lining up toys) seem to be the dominant factors.
39.	421. A 54yo man with alcohol dependence has tremor and sweating 3days into a hosp admission for a fx femur. He is apprehensive and fearful. What is the single most appropriate tx?  a. Acamprossate b. Chlordiazepoxide c. Lorazepam d. Lofexidine e. Procyclidine	The key is B. Chlordiazepoxide. C. Lorazepam is also correct key! [According to NICE 1st line treatment is oral lorazepam and if symptom persists or oral medication is declined, give parenteral lorazepam, haloperidol or olanzapine. According to OHCM 1st line treatment is chlordiazepoxide.  Chlordiazepoxide should only be used at the lowest possible dose and for a maximum of up to four weeks. This will reduce the risks of developing tolerance, dependence and withdrawal].
40.	423. A man with a fam hx of panic disorder is brought to the hosp with palpitations, tremors, sweating and muscles tightness on 3 occasions in the last 6 wks. He doesn't complain of headache and his BP is WNL. What is the single most appropriate long-term tx for him?  a. Diazepam b. Olanzapine c. Haloperidol d. Fluoxetine e. Alprazolam	The key is D. Fluoxetine. [Recommended treatment for panic disorder is i) CBT ii) Medication (SSRIs or TCA).  NICE recommends a total of seven to 14 hours of CBT to be completed within a four month period. Treatment will usually involve having a weekly one to two hour session. When drug is prescribed usually a SSRI is preferred. Antidepressants can take two to four weeks before becoming effective].

41.	425. A 56yo woman who is depressed after her husband died of cancer 3m ago was given amitryptaline. Her sleep has improved and she now wants to stop medication but she still speaks about her husband. How would you manage her?  a. CBT  b. Continue amitryptaline c. Psychoanalysis d. Bereavement counselling e. Antipsychotic	The key is B. Continue amitriptyline. [depression is important feature of bereavement. Patient may pass sleepless nights. As this patients sleep has improved it indicate she has good response to antidepressant and as she still speaks about her husband there is chance to deterioration of her depression if antidepressant is stopped. For depressive episodes antidepressants should be continued for at least 6-9 months].
42.	433. A 30yo man complains of episodes of hearing music and sometimes threatening voices within a couple of hours of heavy drinking. What is the most likely dx?  a. Delirium tremens b. Wernicke's encephalopathy c. Korsakoff's psychosis d. Alcohol hallucinosis e. Temporal lobe dysfunction	The key is D. Alcoholic hallucinosis. [Alcohol hallucinosis can occur during acute intoxication or withdrawal. It involves auditory and visual hallucinations, most commonly accusatory or threatening voices. Source: Wikipedia].
43.	436. A schizophrenic pt hears people only when he is about to fall asleep. What is the most likely dx? a. Hypnopompic hallucinations b. Hyponogogic hallucinations c. Hippocampal hallucinations d. Delirious hallucinations e. Auditory hallucinations	The key is B. Hypnogogic hallucinations.
44.	450. A 32yo man has OCD. What is the best tx? a. CBT b. SSRI c. TCA d. MAO inhibitors e. Reassure	The key is B. SSRI. [It is wrong key! There is a GMC sample question with most appropriate management being CBT. So the correct key is CBT].
45.	451. A 65yo woman says she died 3m ago and is very distressed that nobody has buried her. When she is outdoors, she hears people say that she is evil and needs to be punished. What is the most likely explanation for her symptoms?  a. Schizophrenia b. Mania c. Psychotic depression d. Hysteria e. Toxic confusional state	The key is C. Psychotic depression. [Psychotic depression, also known as depressive psychosis, is a major depressive episode that is accompanied by psychotic symptoms (hallucinations, delusions). In this patient nihilistic delusion favours the diagnosis of psychotic depression. It can occur in the context of bipolar disorder or majordepressive disorder].

46.	457. A 72yo woman who had a repair of strangulated femoral hernia 2 days ago becomes noisy, aggressive and confused. She is febrile, CBC normal apart from raised MCV. What is the most likely dx?  a. Electrolyte imbalance b. Delirium tremens c. Wernicke's encephalopathy d. Infection toxicity e. Hypoglycemia	The key is B. Delirium tremens. [Electrolyte imbalance may cause confusion but not aggressiveness; infection toxicity will cause high fever, low BP, rash etc which are absent here (fever here is hyperthermia of delirium tremens). Abstinance from alcohol in the hospital caused delirium tremens (chronic alcoholism is supported by high MCV) here].
47.	470. A 40yo woman has had intermittent tension, dizziness and anxiety for 4months. Each episode usually resolves after a few hours. She said she takes alcohol to make her calm. She is in a loving relationship and has no probs at work or home. What is the next step in her management?  a. Collateral info b. CT b0rain	The key is A. Collateral info. [Likely diagnosis is panic disorder. Collateral info from family, friends and other peers should be asked to find out the cause for her anxiety].
48.	c. CBC d. LFT e. TFT  472. A 71yo woman looks disheveled, unkempt and sad with poor eye contact. She has recently	The key is È. Low mood.
	lost her husband. Which of the following describes her condition? a. Anxiety b. Hallucination c. Mania d. High mood e. Low mood	
49.	480. A 23yo man comes to the ED with a hx of drug misuse. He recognizes that he has a prb and is willing to see a psychiatrist. Which of the following terms best describes this situation?  a. Judgement b. Thought insertion c. Thought block d. Mood e. Insight	The key is E. Insight. [in psychiatry, the patient's awareness and understanding of the origins and meaning of his attitudes, feelings, and behavior and of his disturbing sy mptoms (self-understanding) is known as insight].
50.	488. A 24yo man asks his GP for a sick note from work. He says that feels down, is lethargic and has stopped enjoying playing the piccolo (his main hobby). He was admitted to the psychiatry ward last year following an episode of overspending, promiscuity and distractibility. What is the most probable dx?  a. Psychosis b. Cyclothymia c. Bipolar affective disorder	The key is C. Bipolar affective disorder. [presently patient has depression and previous features of mania makes the diagnosis of bipolar affective disorder likely].

	d. Seasonal affective disorder	CHIATICI
	u. Seasonal affective disorder	
51.	492. A 40yo woman presents to the GP with low mood. Of note, she has an increased appetite and has gone up 2 dress sizes. She also complains that she can't get out of bed until the afternoon. What is the most likely dx?  a. Pseudo depression b. Moderate depression c. Severe depression d. Dysthymia e. Atypical depression	The key is E. Atypical depression. [Atypical depression is a subtype of major depression or dysthymic disorder that involves several specific symptoms, including increased appetite or weight gain, sleepiness or excessive sleep, marked fatigue or weakness, moods that are strongly reactive to environmental circumstances, and feeling extremely sensitive to rejection].
52.	521 A 22yo man has rushed into the ED asking for help. He describes recurrent episodes of fearfulness, palpitations, faintness, hyperventilation, dryness of the mouth with perioral tingling and cramping of the hands. His symptoms last 5-10 mins and have worsened since their onset 3months ago. He is worried he may be having a heart attack. An ECG shows sinus tachycardia. What is the single most appropriate immediate intervention?  a. High flow oxygen  b. IV sedation  c. Rebreathe into a paper bag  d. Refer for anxiety management course  e. Refer for urgent cardiology opinion	The key is C. Rebreathing into paper bag. [Patient has anxiety disorder (panic) which causes hyperventilation and CO2 washout leading to respiratory alkalosis. Symptoms will improve by rebreathing into paper bag as it will cause gradual increase of CO2 in paper bag and decrease the severity of respiratory alkalosis].
53.	549. A 21yo woman has had several sudden onset episodes of palpitations, sweating, nausea and overwhelming fear. On one occasion she was woken from sleep and feared she was going insane.  There is no prv psychiatric disorder. What is the most probable dx?  a. Pheochromocytoma  b. Panic disorder  c. GAD  d. Phobia  e. Acute stress disorder	The key is B. Panic disorder. [here closest d/d to panic disorder is pheochromocytoma. But in pheochromocytoma the most important feature is resistant hypertension and other important features are headache and abdominal pain which all are absent here. Moreover overwhelming fear is more suggestive of panic disorder. Hence here the diagnosis is B. Panic disorder].
54.	560. A thin 18yo girl has bilateral parotid swelling with thickened calluses on the dorsum of her hand. What is the single most likely dx?  a. Bulimia nervosa b. C1 esterase deficiency c. Crohn's disease	The key is A. Bulimia nervosa. [18 year thin girl, bilateral parotid swelling and thickened calluses on the knuckles from self induced vomiting are suggestive of Bulimia nervosa. Bulimia often is associated with bilateral parotid swelling (parotid hypertrophy)].

		CHAIN
55.	596. A 37yo woman was admitted for femur fx repair after a RTA. On the 4th post-op day she became confused and starts picking on her bed sheets and complains of seeing spiders all over. What is the most likely dx? a. Delirium tremens b. Wernickes encephalopathy c. Korsakoffs psychosis d. Psychotic depression	The key is A. Delerium tremens. [withdrawal of alcohol due to hospital admission lead to delirium tremens. Warnicke's encephalopathy has triad of i) mental confusion ii) abnormal eye movements & iii) unsteady gait. Korsakoff's syndrome cannot be diagnosed until the person has stopped drinking alcohol for several weeks, to enable the immediate symptoms of alcohol intoxication and withdrawal to subside. Features of Korsakoffs psychosis i) dementia, loss of short term memory ii) difficulty in acquiring new information or learning new skills iii) personality change iv) confabulation].
56.	605. A 32yo lady complains that she hears everyone saying that she is an evil person. What type of hallucinations is she suffering from?  a. 2nd person auditory hallucinations b. 3 <sup>rd</sup> person auditory hallucinations c. Echo de la pense d. Gedankenlautwerden	The key is B. 3 <sup>rd</sup> person auditory hallucinations. [Third person hallucinations are auditory hallucinations in which patients hear voices talking about themselves, referring to them in the third person, for example "he is an evil person".].
57.	612. A 50yo man complains of being pursued by the police for a crime he denies committing. He has poor concentration and impaired short-term memory. He admits to drinking large amounts of alcohol for the last 20yrs. What is the most probable dx?  a. Dementia b. Hallucination c. Wernicke's encephalopathy d. Schizophrenia e. Korsakoff psychosis	The key is E. Korsakoff psychosis. [Dementia, i.e. short term memory loss is seen in korsakoff psychosis].
58.	620. A 36yo woman was recently admitted to a psychiatric ward. She believes that the staff and other pts know exactly what she is thinking all the time. What is the most likely symptom this pt is suffering from?  a. Thought insertion b. Thought withdrawal c. Thought block d. Though broadcasting e. Hallucination	The key is D. Thought broadcasting.

	PSICHIAINI		
83.	751. A guy who has several convictions and has been imprisoned several times, breaks up with his family and doesn't contact his children. What type of personality disorder is this?  a. Borderline b. Antisocial c. Schizotypal d. Schizoid e. Criminal	The key is B. Antisocial. [Antisocial personality disorder is characterized by a pervasive pattern of disregard for, or violation of, the rights of others. There may be an impoverished moral sense or conscience and a history of crime, legal problems, and impulsive and aggressive behavior].	
84.	761. A lady with depression has a bag full of meds.  She now presents with coarse tremors. Which drug caused her symptoms?  a. Lithium  b. Thyroxine  c. Amitriptyline  d. Sodium valproate  e. Tetrabenazine	The key is A. Lithium. It is a wrong key! Right key is D. Sodium valproate. [Side effect of lithium in therapeutic range is fine tremor. Sodium valproate (a well known mood stabilizer) can cause coarse tremor in therapeutic range].	
85.	767. A 49yo man lost his job and now is homeless. He was found wandering in the park. He is muttering that some people are after him. Alcohol was tested and it was negative. What will your next step be? a. Thiamine b. Neuropsycho analysis c. Mini mental state d. CT head e. MRI head	The key is B. Neuropsychoanalysis. [As the patient has persecutory delusion he is likely suffering from psychosis for which neuropsychoanalysis is the logical approach].	
86.	888. A 45yo man has been admitted for an elective hernia surgery. 3d later he presents with agitation, sweating, aggressiveness, and complains of seeing snakes on the hosp wall. Chlordiazepoxide has been started for this pt. What is the most appropriate next step?  a. Diazepam  b. Acamprosate  c. Disulfiram  d. Thiamine	The key is D. Thiamine. [Dx is delirium tremens. So following chlordiazepoxide thiamine is the appropriate next step].	
87.	959. A 48yo woman always socially withdrawn has stopped going out of the house. She is afraid to socialize because she fears that people will criticize her. What is the most probable dx?  a. Agoraphobia b. PTSD c. Social anxiety d. OCD e. GAD	The key is C. Social anxiety. [Social anxiety disorder is a type of complex phobia. This type of phobia has a disruptive or disabling impact on a person's life. It can severely affect a person's confidence and self-esteem, interfere with relationships and impair performance at work or school].	
88.	965. A lady who is alcohol dependent wants to quit but wants someone to encourage her. What would you do?  a. Medication b. Refer to social services c. Refer to psychology d. CBT	The key is B. Refer to social services.	

89. 969. A 43yo woman presents with low mood, loss The key is B. Moderate depression. [Mild depression: of libido, sleep disturbance, tiredness, palpitation, i)Low mood ii) Anhedonia iii) Guilt iv) Hopelessness v) chest discomfort, irritability and recurrent worries. Worthlessness vi) Inability to concentrate. Tx CBT What is the most likely dx? Moderate depression: Features of mild + vii) Poor sleep a. Seasonal Affective Disorder viii) Poor Appetite ix) Poor libido x) Easy fatiguability. Tx b. Mod depression Antidepressants c. Dysthymia Severe depression: Features of moderate + xi) Suicidal d. GAD intensions. Tx ECT]. e. Bipolar disorder 90. 973. A young man has been found in the park, The key is E. Paranoid personality disorder. [Patients drunk and brought to the ED by ambulance. He disease (Paranoid personality disorder) is responsible recently lost his job and got divorced. He thinks for his divorce and loss of job. Suspiciousness to wife is nurses are plotting against him. What is the reason for divorce]. most likely dx? a. Schizoid personality b. Borderline personality c. Schizophrenia d. Psychotic depression e. Paranoid 91. Paranoid personality disorder: DSM v. Berstein DSM-IV criteria (summarised) Primary traits identified by Berstein (2007) Extreme distrust of others from an early age Mistrust/suspiciousness Antagonism/aggressiveness Bearing persistent grudges Preoccupation with suspicions that others want to harm or deceive them Introversion/excessive autonomy Belief that sexual partners are unfaithful Hypersensitivity Reluctance to confide for fear of malicious use of information given Hypervigilance Perception of innocent incidents as threatening Rigidity 92. 977. A 26yo political refugee has sought asylum in The key is B. PTSD. [Keep getting thoughts of his family the UK and complains of poor conc. He keeps disaster, insomnia, to avoid similar circumstances he is getting thoughts of his family whom he saw killed avoiding going out these are suggestive of PTSD]. in a political coup. He is unable to sleep and feels hopeless about his survival. Because of this he is afraid to go out. What is the most likely dx? a. Acute stress disorder b. PTSD c. Social phobia d. OCD e. GAD

93.	998. A 32yo man with schizophrenia and a hx of violence and distressing auditory hallucinations was admitted to the ward with aggressive behavior and has already smashed his room. He is refusing any oral meds. What is the single most appropriate injection?  a. Flupenthixol b. Fluphenazine c. Haloperidol d. Paraldehyde e. Risperidone	The key is C. Haloperidol. [If oral preparation was asked we could give risperidone but in question asked injectable preparation. Injection Risperidone is a depot preparation the action of which takes few days to start. So in acute case it is not suitable; hence from the given options haloperidol is the best choice].
94.	1016. A 24yo woman has severe depression 3m after the birth of her first child. She is breastfeeding but is otherwise unable to look after the baby and is convinced that her family is likely to kill her.  She has no interest in anything and keeps crying. What is the most appropriate tx?  a. Fluoxetine b. Citalopram c. CBT d. ECT e. Haloperidol	The key is D. ECT. [ [In question it is mentioned she has severe depression. In severe depression the tx is ECT].
95.	1018. A couple has just finished their detox regime and wants a drug with a pharmacological action to serve as a deterrent when they take alcohol. What drug is the appropriate choice?  a. Disulfiram  b. Acamprosate  c. Vitamin supplement  d. Naloxone  e. Naltrexone	The key is B. Acamprosate. This is a wrong key! Correct key is A. Disulfiram. [Acramposate is not a deterrent (which keeps away from drinking by making it unpleasant) but Disulfiram!]
96.	1023. A 75yo man has been attending the clinic for lower urinary tract symptoms. His mood is very low and he says he feels unhappy, anxious and unable to sleep. He has been dx with moderate depression. What tx would be most effective for this pt?  a. Amitriptyline b. Citalopram c. CBT d. Dosulepin e. Diazepam	The key is B. Citalopram. [Mild depression = CBT, Moderate depression = Antidepressant, Severe depression & Psychotic depression = ECT, Amitryptiline and Dosulepine causes urinary retention (which is comperatively less in citalopram) so not suitable in a patient with lower urinary symptoms. Hence Citalopram is the preferred option].

	considerable strain on their marriage. What is the most likely dx?  a. Fregoli syndrome  b. Cotard syndrome  c. Mood disorder  d. Ekbom syndrome  e. Othello syndrome	
115.	1219. A 26yo man strongly believes that every elderly man he meets is his father. Although they look different, he is sure it is father wearing different disguises. What kind of delusions is this man suffering from?  a. Delusion of persecution	The key is D. Delusion of doubles. [The Fregoli delusion, or the delusion of doubles, is a rare disorder in which a person holds a delusional belief that different people are in fact a single person].
	<ul><li>b. Erotomania</li><li>c. Delusion of grandeur</li><li>d. Delusion of doubles</li><li>e. Delusion of reference</li></ul>	
116.	1225. A 56yo alcoholic man who has increased the amount of alcohol he is using wants to attend his daughter's wedding that is in 2wks. He is now coming to you for help. How would you help him?  a. Acamprosate  b. Refer to clinical psychologist  c. Refer to GP  d. Despiramine  e. Refer to community mental health support	The key is A. Acamprosate. [If the patient stop alcohol without any supportive treatment there will occur withdrawal symptoms. For the presented situation Acamprosate can help by stopping alcohol without producing withdrawal symtoms (by restoring brain chemical derangement caused by alcohol which is responsible for withdrawal symptoms)].
	group.	

117.	1234. A 22yo man keeps having persistent and intrusive thoughts that he is a dirty thief. No matter what he tries these thoughts keep coming to him. Any attempt to avoid these thoughts leads to serious anxiety. What is the most likely dx? a. Schizophrenia	The key is B. OCD. [Though here no obsession or thoughts but no compulsion of activity but there is compulsion of thoughts as well which makes the diagnosis as OCD].
	b. OCD c. PTSD d. Mania	RSALE
	e. Psychotic depression	
118.	1236. A 30yo man is becoming concerned about the safety of his family. He has been checking the locks of the door every hour during the night. He becomes very anxious if his wife tries to stop him. What is the most likely dx?  a. Paranoid delusion b. PTSD c. Social phobia d. OCD e. GAD	The key is D. OCD. [Obsessive compulsive disorder (OCD) is a mental health condition where a person has obsessive thoughts and compulsive activity.  An obsession is an unwanted and unpleasant thought, image or urge that repeatedly enters a person's mind, causing feelings of anxiety, disgust or unease.  A compulsion is a repetitive behaviour or mental act that someone feels they need to carry out to try to temporarily relieve the unpleasant feelings brought on by the obsessive thought].
119.	1251. A 22yo girl unhappy about her weight with BMI=22. She likes to have her dinner in an expensive restaurant. She does excessive shopping. K+=3.3. What is the dx? a. Anorexia nervosa b. Bipolar c. OCD d. Bulimia	The key is D. Bulimia. [BMI 22, even though unhappy, hypokalemia, like to have dinner in an expensive restaurant (probable binge eating) suggest the diagnosis of bulimia].
120.	1268. A 36yo pregnant woman comes for evaluation with her husband. Her husband has been complaining of morning sickness, easy fatiguability and even intermittent abdominal pain. What is the husband suffering from?  a. Ganser syndrome b. Couvade syndrome c. Pseudo-psychosis d. Stockholm syndrome e. Paris syndrome	The key is B. Couvade syndrome. [Cauvade syndrome, also called sympathetic pregnancy, is a proposed condition in which a partner experiences some of the same symptoms and behavior of an expectant mother].
121.	1283. A 77yo publican was admitted for an appendectomy. Post-op he becomes confused, agitated and starts to pick at things. He is then given an IV drug which settles this confusion. Which of the following drugs was given for his confusion?  a. Diazepam b. Chlordiazepoxide c. Thiamine d. Vit B	The key is B. Chlordiazepoxide. [Patient is alcoholic. On admission abstinence from alcohol caused this withdrawal symptom. Agitation, confusion and pick at things are suggestive of delirium tremens which is treated with Chlordiazepoxide].

		CHAIN
122.	1289. A child with T1DM who is not compliant with meds and eats a lot. He thinks that he is short in his class. He is not happy. What would you do next?  a. Refer to psychologist	The key is A. Refer to psychologist. [Not compliant with medicine, eating a lot, thinking of being short and being unhappy these are psychological issues. So he should be referred to psychologist].
	b. Refer to pediatrician c. Refer to GP d. Refer to social services e. Change type of insulin	RSALE
123.	1311. A 28yo woman with hx of drug addiction wants to start a family and have a baby. She would like to stop taking heroin and asked for something to help her stay away from it. What drug tx would you give her?  a. Naloxone b. Acamprosate c. Methadone d. Chlordiazepoxide e. Naltrexone	The key is C. Methadone. [Methadone is a powerful synthetic analgesic drug which is similar to morphine in its effects but less sedative and is used as a substitute drug in the treatment of morphine and heroin addiction].
124.	1334. A woman complaining of diarrhea, abdominal pain and fatigue. All the tests are found to be normal. What is the cause?  a. Somatization b. Conversion c. Hypochondriasis	The key is A. Somatization. [Somatization disorder is patients presenting with any physical symptom and frequent medical visits in spite of negative investigations].
125.	1339. A 9yo child doesn't play with his peers and has collected 200 cars. He doesn't respond to any criticism. What is the dx? a. Autism b. Personality disorder c. Schizophrenia d. Rett syndrome e. Social anxiety	The key is A. Autism.
126.	1367. A pt has had 1 ep of depression and 2 eps of mania over the last year and now presents with depression. He is on anti-depressants. What additional pharmacological tx would now act as a prophylaxis for his condition?  a. Antidepressants b. Antipsychotics c. Mood stabilizers d. No additions req	The key is C. Mood stabilizers. [Antidepressant alone can lead to manic attack and to prevent this a mood stabilizer is required].
127.	1391. A schizophrenic man complains that he can hear voices talking about him and telling him to end his life by cutting his throat. He only hears them when he wakes up from sleep and not at other times. What type of hallucinations is he having?  a. Somatic b. Kinesthetic c. Hypnogogic d. Hypnopompic	The key is D. Hypnapompic hallucination. [Hallucinations during going for sleep is hypnagogic and hallucinations during wake up from sleep is hypnapompic hallucinations].

43.	e. US  903. A pt presents with progressive dyspnea. He complains of cough, wheeze and a table		The key is A. Chronic bronchitis. [Progressive dyspnoea, wheeze productive cough and the result of spirometry
	spoonful of mucopurulent sputum for the last 18m. Spirometry has been done. FEV1/FVC=2.3/3.6. After taking salbutamol, the		(prebronchodilator FEV1/FVC ratio of 64% and postbronchodilator FEV1/FVC ratio of 65%] points towards the diagnosis of chronic bronchitis. Some may
	ratio=2.4/3.7. What is the most likely dx? a. Chronic bronchitis b. Asthma		think of bronchiectasis! But in bronchiectasis there is copious purulent sputums (as cup full of sputum not table spoon full!!!)].
	c. Bronchiectasis d. Lung fibrosis e. Sarcoidosis		
44.	904. A 62yo man presents with cough, breathlessness and wheeze. 24% O2, salbutamol and hydrocortisone were given. The symptoms haven't improved and so nebulized bronchodilator was repeated and IV aminophylline was given. ABG: pH=7.31, RR=32. What is the next appropriate management? a. Nasal IPPV b. Intubation and ventilation c. LABA d. Toxapram e. Amoxicillin PO		The key is A. Nasal IPPV. [Here given case is COPD has following indications of Nasal IPPV i) Tachypnea (>24 breaths/min) and ii) Hypercapnic respiratory acidosis (pH range 7.10-7.35)].
45.	909. A 19yo man has exercised induced asthma and is using a salbutamol inhaler as req and beclamethasone 400ug BD. He complains that he has to wake up at night for his inhaler. What is the single most appropriate tx?  a. Beclo  b. Regular salbutamol and budesonide c. Sodium cromoglycate d. Oral steroid e. Inhaled steroid		The key is C. Sodium cromoglycate. [the patients current complaint is nocturnal asthma for which next step is long acting beta blocker!! This question is probably a bad recall].
	NOTFO	) F	RSALE

46.	d. Large cell ca	) F	No key is given!! Correct answer is D. Large cell ca. [Large cell carcinoma is, by definition, a poorly differentiated malignant epithelial tumor. It consists of sheets or nests of large polygonal or giant multinuclear cells and probably represents SCC ."]
47.	e. Oat cell ca  916. An 83yo man with longstanding COPD has become progressively breathless over the last 2yrs. He is on salbutamol, ipratropium, salmetarol, beclomethasone and theophylline. His FEV1<30%. What is the next appropriate management? a. Lung transplant b. Trial of CPAP c. Trial of non-invasive ventilation d. Assessment for long term O2 therapy e. Short course of O2 therapy		The key is D. Assessment for long term O2 therapy. [Patient is progressively breathless with present FEV1 of <30%. So his respiratory deterioration indicates progressive respiratory failure for which he should be assessed for long term O2 therapy. Long-term oxygen therapy (LTOT) for more than 15 h/day improved mortality and morbidity in a well-defined group of patients with chronic obstructive pulmonary disease. Requirement of condition to proceed to LTOT is patient should be stable and on appropriate optimum therapy (as in given case) and having stopped smoking tobacco. Patient should be shown to have a PaO2 less than 7.3 kPa and/or a PaCO2 greater than 6 kPa on two occasions at least 3 weeks apart. FEV1 should be less than 1.5 litres, and there should be a less than 15% improvement in FEV1 after bronchodilators. Patients with a PaO2 between 7.3 and 8 kPa who have polycythaemia, right heart failure or pulmonary hypertension may gain benefit from LTOT].
49.	922. A 71yo man with a hx of 50yrs of smoking presents with cough, hemoptysis, dyspnea and chest pain. He also has anorexia and weight loss. The dx of lung cancer has been stabilized. Which electrolyte abnormality can be seen?  a. Hyperkalemia b. Hypocalcemia c. Hyponatremia d. Hypernatremia e. Hypomagnesemia  924. A 33yo man has a temp=38.5C, cough and chest pain on the right side on inspiration. He also has purulent sputum. What is the most likely		The key is C. Hyponatremia. [Likely diagnosis is squamous cell lung cancer (as the patient is smoker) causing SIADH and resulting hyponatremia].  The key is C. PCP cold agglutinins. It is wrong key!  Correct key should be A. Gram +ve diplococci. [It is a case of community acquired pneumonia caused by streptococcus pneumoniae].
	organism to cause pneumonia in this pt?  a. Gram +ve diplococcic	DF	RSALE

50.	935. A 62yo man has been smoking about 15 cigarettes/day for 45yrs, and has been working as a builder since he was 24yo. He presents with chest pain, SOB, weight loss. CXR shows bilateral fibrosis and left side pleural effusion. What is the best inv that will lead to dx?  a. CXR  b. Pleural fluid aspiration of cytology c. MRI d. Pleural biopsy e. CT	i F i	The key is D. Pleural biopsy. [There is asbestos exposure in builders and associated smoking greatly increases the possibility of developing mesothelioma and the given presentation is typical of mesothelioma. Best investigation is pleural biopsy].
51.	980. A 39wk pregnanct woman came to labor suite 3d after an obstructed labour presents with pain and swelling of one leg. Exam: leg has blue mottling and is cold. What is the dx?  a. DVT  b. Post phlebitis syndrome c. Embolus d. Varicose vein e. Herpes gladiatorum		The key is C. Embolus.
52.	996. A 64yo man complains of increasing SOB and cough for the past 18m. He coughs up a Tbsp of mucopurulent sputum with occasional specks of blood. What is the most likely underlying cause?  a. Acute bronchitis b. Bronchiectasis c. Chronic bronchitis d. Lung cancer e. Pneumonia	i i	The key is C. Chronic bronchitis. [There may be specks of blood in sputum in both bronchiectasis, acute and chronic bronchitis. Duration of disease is 18 months, so it is not acute bronchitis. Again only one tablespoonful sputum does not justify the term copious sputum of bronhiectasis in which sputum will be much more like cup-full in amount. So it is chronic bronchitis].
53.	1009. A 75yo man presents with Bell's palsy. His PMH is significant for late onset asthma and heart failure. He also reports to have consulted his GP for generalized rash prv. CXR: multiple soft shadows and CBC: eosinophilia. What is the single most likely positive antibody?  a. P ANCA b. C ANCA c. Anti Ro d. Anti DS DNA e. Anti centromere		The key is A. p-ANCA. [The dx is Charg Strauss Syndrome (CSS). There are six criteria for dx of CSS:  1. Asthma (wheezing, expiratory rhonchi).  2. Eosinophilia of more than 10% in peripheral blood.  3. Paranasal sinusitis.  4. Pulmonary infiltrates (may be transient).  5. Histological confirmation of vasculitis with extravascular eosinophils.  6. Mononeuritis multiplex or polyneuropathy.  The presence of four out of six of these features has a high specificity and sensitivity for the diagnosis of CSS.  In the given case there are 1. Bell's palsy (mononeuritis multiplex) 2. Asthma 3. Multiple soft shadows on CXR (pulmonary infiltrates) 4. Eosinophilia. Presence of these 4 features are diagnostic of CSS. In CSS 70% patient is p-ANCA positive!].

J.	the left half of her skull. She also complains of	2. The diagnosis is Giant cell arteritis or	
	pain around her jaw. What is the next likely step?	temporal arteritis.	
	a. CT	3. Points in favour: i) Age >50yrs ii)	
	b. MRI	Female sex iii) Severe pain in the left half	
	c. Fundoscopy	of skull iv) Pain around the jaw (jaw	
	d. ESR	claudication).	
	e. Temporal artery biopsy	Ciadalcation).	
	C. Temporar artery biopsy		

6.	430. A 45yo woman complains of pain in her hands precipitated by exposure to the cold weather. She has breathlessness on walking. When she is eating, she can feel food suddenly sticking to the gullet. It seems to be in the middle of the esophagus but she can't localize exactly where it sticks. It is usually relieved with a drink of water. Choose the single most likely cause of dysphagia from the options?  a. Esophageal carcinoma  b. Systemic sclerosis c. SLE d. Pharyngeal carcinoma	The key is B. Systemic sclerosis. [Raynods phenomena, pulmonary involvement, oesophageal dysmotility are suggestive of systemic sclerosis].	
7.	e. Globus hystericus  487. A 62yo lady presents with right sided headache and loss of vision. What is the single most inv?  a. ESR b. BUE c. CT head d. XR orbit e. IOP	The key is A. ESR. [Elderly (age 62), rt sided headache and loss of vision are suggestive of temporal arteritis where elevated ESR is highly suggestive of this diagnosis].	
8.	496. A 45yo woman has been dx with GCA and is being treated with steroids. What is the other drug that can be added to this? a. ACEi b. Beta blockers c. Aspirin d. Interferons e. IVIG	The key is C. Aspirin [Low dose aspirin is increasingly being recommended for people with a history of giant cell arteritis. It has been found to be effective in preventing complications of giant cell arteritis, such as heart attacks or stroke (nhs.uk)].	
9.	518. A 70yo woman presents with recurrent episodes of parotid swelling. She complains of difficulty in talking and speaking and her eyes feel gritty on waking in the morning. What is the single most likely dx?  a. C1 esterase deficiency b. Crohns disease c. Mumps d. Sarcoidosis e. Sjogrens syndrome	The key is E. Sjogrens syndrome. [parotid swelling, difficulty talking and speaking (due to dryness or less salive), eyes feeling gritty on waking in the morning due to dryness of eye are suggestive of Sjogrens syndrome].	
10.	582. A 78yo woman presents with unilateral headache and pain on chewing. ESR=70mm/hr. She is on oral steroids. What is the appropriate additional tx?  a. Bisphosphonates b. HRT c. ACEi d. IFN e. IV steroids	The key is A. Bisphosphonates. [The elderly lady with giant cell arteritis is getting high dose steroid which can lead to demineralization and osteopenia or osteoporosis. So to prevent this bisphosphonates are given].	

11.	632. A 34yo man complains of arthralgia, abdominal pain and vomiting, a facial rash that is worse in the summer and hematuria. Urea and creatinine are slightly elevated with urinalysis demonstrating red cell casts. PMH is remarkable for childhood eczema. Which inv is most likely to lead to a dx?  a. US KUB b. Joint aspiration c. Auto antibodies d. IVU e. Renal biopsy	The key is C. Auto antibodies. [Likely diagnosis is SLE for which auto antibody (anti ds DNA antibody) should be done].  A
12.	647. A 35yo woman undergoing tx for TB presents with malar rash, photosensitivity and hematuria. What is the single most likely positive antibody? a. Anti Ds DNA b. Anti Sm c. Anti Histone d. Anti La e. Anti centromere	The key is C. Antihistone antibody. [Anti histone antibody is present in 95% cases of drug induced lupus].
13.	662. A 35yo woman has butterfly rash on her face and she suffers symmetrical joint pains on knee and elbow, ESR is raised. What is the most discriminative inv for dx? a. Anti DNA antibodies b. Anti Jo1 antibodies c. Anti nuclear antibodies d. Anti centromere antibodies e. Anti la antibodies	The key is A. Anti DNA antibodies. [Anti DNA antibodies to diagnose SLE].
14.	719. A 70yo man presented with muscle weakness and inability to climb the stairs. Inv: CPK raised, ESR 15. What is the most likely dx? a. Polymyositis b. Polymyalgia rheumatic c. Reactive arthritis d. RS e. Duchenne's MD	The key is A. Polymyositis. [Proximal muscle weakness (inability to climb the stairs) and raised CPK points towards polymyositis].
15.	841. A 36yo lady comes with hx of early morning stiffness of her small joints and with red and painful eye. What is the single most appropriate option? a. Iris b. Ciliary body c. Cornea d. Conjunctivitis e. Sclera f. Lichen planus	The key is E. Sclera. [Ocular manifestation of rheumatoid arthritis is scleritis (red, painfull eye)].
16.	849. A 28yo man is inv for recurrent lower back pain. A dx of AS is suspected. Which of the following inv is most useful?  a. ESR  b. XR sacro-iliac joints c. HLA B27 d. XR thoracic spine e. CT lumbar spine	The key is B. XR sacro-iliac joints. [x-ray sacroiliac joint shows fusion of both SI joints and thin, symmetrical syndesmophytes bridging the intervertebral disc spaces].

17.	868. A 35yo male who recently had an appendicectomy	The key is C. Gout. [Alcoholic drinks can	
	has got severe pain in his right big toe. Joint	raise the level of uric acid in the blood].	
	is red and swollen. He consumes 30 units of alcohol/week. What is the most probable dx?

	•	
	c. Smoking	
	d. Splenectomy	FOR SALE
	e. Sub-phrenic collection	

45.	507. A 45yo man had cancer of head of pancreas which has been removed. He has a hx of longstanding heartburn. He now comes with rigid abdomen which is tender, temp 37.5C, BP=90/70mmHg, pulse=120bpm. What is the next step of the inv? a. CT abdomen b. XR abdomen c. MRI abdomen d. US abdomen e. Endoscopy	The answer is B. X-ray abdomen. [X-ray abdomen will help diagnosing perforation by showing gas under diaphragm. This is a case of perforated peptic ulcer with the features of shock, abdominal rigidity and raised temperature. Stress from serious disease and operation causes the body to produce higher amounts of acid, which can irritate preexisting ulcers leading to easy perforation].
46.	534. A 64 yo woman has been treated for breast cancer with tamoxifen. What other drug should be added to her tx regime?  a. Bisphosphonates b. Calcium c. Vit D d. Calcitonin e. Phosphate binders	The key is A. Bisphosphonates. [bisohosphonates reduce the risk of bone metastasis in cancers and is normally taken as adjuvant therapy in many types of tumours including breast cancer. Plus it prevents bone resorption].
47.	556. A pt after transurethral prostatic biopsy. What electrolyte imbalance can he develop? a. Hyperkalemia b. Hyponatremia c. Hypocalcemia d. Hypernatremia e. Hypercalcemia	The key is B. Hyponatremia. [Use of fluid for bladder irrigation may lead to hyponatremia].
48.	564. A 45yo man with colon cancer now develops increased thirst, increased frequency in urination and weight loss. His fasting blood glucose=9mmol/L. what is the most appropriate management? a. Oral hypoglycemic b. Insulin long acting c. Short acting insulin before meal d. IV insulin e. Subcutaneous insulin	The key is A. Oral hypoglycemic. [Increased thirst and increased frequency in urination along with weight loss is suggestive of DM supported by fasting blood glucose of 9 mmol/L. At the age of 45 most likely type of diabetes is NIDDM or type 2 DM which is treated by oral hypoglycemic agents].
49.	580. An 83yo woman who is a resident in a nursing home is admitted to hospital with a 4d hx ofdiarrhea. She has had no weight loss or change in appetite. She has been on analgesics for 3wks for her back pain. She is in obvious discomfort. On rectal exam: fecal impaction. What is the single most appropriate immediate management?  a. Codeine phosphate for pain relief b. High fiber diet c. Oral laxative d. Phosphate enema e. Urinary catheterization	The key is D. Phosphate enema. [In feacal impaction oral laxative is not the choice but phosphate enema is the best option here].

50.	595. A 9m child is brought to the ED with an irreducible firm swelling which descended into the left groin when the child has been crying. Exam: both testicles are palpable in the scrotum. What is the most appropriate management strategy?  a. Reassurance b. Emergency herniotomy c. Elective herniotomy d. Emergency herniotomy + orchidopexy e. Elective herniotomy + orchidopexy	The key is C. Elective herniotmy. [If there was features of strangulation we would go for emergency herniotomy. But as only irreducible we shall proceed to elective herniotomy].  FOR SALE
51.	606. A 65yo woman had an excision of colonic tumor 3yrs ago. Now she is losing weight and feels lethargic. Exam: pale but no abdominal findings. What is the most appropriate inv?  a. CA 125 b. CA 153 c. CA 199 d. CEA e. AFP	The key is D. CEA. [CA 125 = ovarian cancer; CA 153 = cancer breast; CA 199 = pancreatic cancer; CEA = colorectal carcinoma; AFP = hepatocellular carcinoma].
52.	642. A 75yo woman presents to the breast clinic having noticed that she has had a blood stained discharge from the left nipple, together with dry skin over the left areola. Exam: blood stained discharge with dry flaky skin noted on the left areola. The nipple was noted to be ulcerated. Wht is the most appropriate inv?  a. FNAC b. MRI c. Punch biopsy d. Open biopsy e. Stereotactic biopsy	The key is C. Punch biopsy. [As the lesion is on the surface punch biopsy can be well obtained].
53.	646. A 46yo woman has offensive yellow discharge from one nipple. She had a hx of breast abscess 3yrs ago. What is the possible dx?  a. Duct papilloma b. Duct ectasia c. Duct fistula	The key is C. Duct fistula.

85.	947. An 80yo DM lady presents with redness and swelling over her right foot. It is tender to touch, warm and glossy. What are the complications this pt might develop?  a. Meningitis b. Sepsis c. Ulcer d. Gangrene	The key is D. Gangrene.
86.	948. After surgery a pt's left leg has become swollen and tender. The diameter of the calf has increased and passive movements cause pain. What is the most probable dx?  a. DVT  b. Lymphedema c. Peripheral vascular disease	The key is A. DVT. [Swelling, tenderness and enlarged calf diameter are features of DVT supported by positive Homan's test (pain on passive movement)].

- 87. 956. A 65yo man on dexamethasone underwent surgery. During and after the surgery, his blood glucose was around 17-19mmol/l. What will you give the pt?
  - a. Insulin
  - b. Oral hypoglycemic
  - c. Remove dexamethasone
  - d. IV Saline
  - e. IX dextrose

The key is D. IV saline. [It is estimated that adults secrete 75-150mg of cortisol in response to major surgery and 50mg a day for minor surgery, and secretion parallels duration and extent of surgery
Patients undergoing a surgical procedure or responding to stress, trauma, or an acute illness will exhibit an increase in adrenal cortisol production up to 6-fold normal levels. However, in patients on chronic exogenous steroid therapy, atrophy of the hypothalamicpituitary-adrenal (HPA) axis may occur through feedback inhibition, leading to an inability to respond to stress. It has historically been believed that patients receiving long-term corticosteroids require supplemental, perioperative doses, and that failure to provide such coverage in secondary adrenal insufficiency may lead to an adrenal crisis characterized by hypotension and cardiovascular collapse.

\*\*\* So who are telling remove dexamethason are wrong!!!\*\*\*
patients receiving "physiologic replacement" doses (<10 mg/ day) do
not need additional steroids perioperatively beyond their standard
regimen. Patients receiving doses exceeding the normal expected stress
response for their surgery (>150 mg/ day of hydrocortisone equivalent
for moderate/major surgery, or >50 mg/ day of hydrocortisone
equivalent for minor surgery) also do not need additional coverage
beyond their current therapy, because acute immunosuppressive doses
are more than sufficient to maintain cardiovascular stability during the
operation.

Regular daily dose of more than 10 mg prednisolone within the last three months:

- i) Minor surgery: 25 mg hydrocortisone at induction
- ii) Moderate surgery Usual pre-operative steroids (Hysterectomy) + 25 mg hydrocortisone at induction + 100 mg hydrocortisone/day
  - iii) Major surgery Usual pre-operative steroids

Major trauma, prolonged + 25 mg hydrocortisone at induction surgery + 100 mg hydrocortisone/day for 2 – 3 days

Surgical patients commonly develop hyperglycemia related to the hypermetabolic stress response, which increases glucose production and causes insulin resistance. Although hyperglycemia is associated with worse outcomes, the treatment of hyperglycemia with insulin infusions has not provided consistent benefits. Despite early results, which suggested decreased mortality and other advantages of "tight" glucose control, later investigations found no benefit or increased mortality when hyperglycemia was aggressively treated with insulin. Because of these conflicting data, the optimal glucose concentration to improve outcomes in critically ill patients is unknown. There is agreement, however, that hypoglycemia is an undesirable complication of intensive insulin therapy and should be avoided.

So, "FOR PERIOPERATIVE HYPERGLYCEMIA NO NEED OF INSULIN" just IV saline!!!].
